1. GENERAL

1.01 This section describes a method of testing AMA translator cross-connections in No. 1 Crossbar offices using the line verification test circuit SD-27154-01.

1.02 This issue affects the Equipment Test List.

1.03 The tests covered are:

A. Verification Tests of all Line Locations—Using Maintenance Recorder: This test makes a record of all AMA translator cross-connections by taking trouble records of all equipped line locations and their associated party indication, office indices, and directory numbers. Verification is made by comparing the perforations of the trouble record with office records.

B. Verification Test of Desired Lines—Using Maintenance Recorder: This test verifies that only the correct line location is translated to an office index and directory number. This test will take a trouble record for all line locations that translate to the office index and directory number under test. Verification is made by comparing the perforations of the trouble record with office records. A maximum of five numbers, or ten with option Z may be verified on one test cycle.

C. Verification Test of Single Line—Using Maintenance Recorder: This test verifies that a single preselected line location is translated to the correct office index and directory number by taking a trouble record of the line location and corresponding translated party indication, office index, and directory number. Verification is made by comparing the perforations of the trouble record with office records.

D. Verification Test of Desired Lines—Without Maintenance Recorder: This test verifies that only the correct line location is translated to an office index and directory number. This test gives a lamp display of all line locations that translate to the office index and directory number under test. Verification is made by comparing the lamp display with office records. A maximum of five numbers, or ten with option Z may be verified on one test cycle.

E. Verification Test of Single Line—Without Maintenance Recorder: This test verifies that a single preselected line location is translated to the correct office index and directory number by giving a lamp display of the line location and corresponding translated party indication, office index, and directory number. Verification is made by comparing the lamp display with office records.

1.04 Test A will generate a complete list of all equipped line location—directory number
assignments. This test would particularly be made to verify pre-cutover cross-connections.

1.05 At any time during the individual test, operation of the LP lamp key will facilitate a progress check of the test circuit.

1.06 Test A, B, or C will cause the TNM register to score once for each number trap or line verification. The reading of this register will provide maintenance personnel with the number of trouble entries to expect.

1.07 Test A, B, or C which encounters a maintenance recorder plugged busy will cause the test circuit to lock in a lamp display of the line location along with the MRB lamp, and an audible alarm from the alarm circuit. The AR key releases the alarm and the lamp display. The make-busy plug must be removed before performing these tests.

1.08 The maintenance recorder tape generated by Test A, B, or C may be translated to a printed list with the use of the maintenance reader and printer circuit.

1.09 Lettered Steps: A letter a, b, c, etc, added to a step number in Part 4 of this section indicates an action which may or may not be required depending on local conditions. The condition under which a lettered step or a series of lettered step should be made is given in the ACTION column and all steps governed by the same condition are designated by the same letter.

A. Verification Tests of All Line Locations—Using Maintenance Recorder

1. Set all NM- switches designated OFF, TH, H, T, and U to OFF.

2. Operate proper MG- key.

3. Set LCH, LCT, and LCU switches to agree with size of office served by marker group.

4a If tip party lines are to be tested—Operate TP key.

5. Operate LV key.

2. APPARATUS

All Tests

2.01 AMA translator line verification test circuit SD-27154-01.

3. PREPARATION

Test A

3.01 Obtain from office records the line equipment numbers and associated directory or billing number of all lines associated with the translators under test.

Tests B, C, D, and E

3.02 Obtain from office records the line equipment numbers and associated directory or billing number of the particular line(s) under test.

Tests A, B, and D

3.03 Obtain from office records the highest numbered equipped column for the marker group under test in order to determine the setting of the LCH, LCT, and LCU switches.

4. METHOD

STEP ACTION VERIFICATION

A. Verification Tests of All Line Locations—Using Maintenance Recorder

1. Set all NM- switches designated OFF, TH, H, T, and U to OFF.

2. Operate proper MG- key.

3. Set LCH, LCT, and LCU switches to agree with size of office served by marker group.

4a If tip party lines are to be tested—Operate TP key.

5. Operate LV key.
STEP | ACTION | VERIFICATION
---|---|---
6 | Momentarily operate ST key. | Trouble record taken at maintenance recorder of each equipped line location in office.

    Note: If testing is to start at line location other than 00000, perform Steps 5 through 10 of Test C before operating ST key.

7b | If test circuit is to be stopped before end of test cycle—Operate STP key. | Test circuit stopped.

8b | Release STP key. | Test circuit resumes testing.

9 | Momentarily operate AR key. | ET lamp lighted.

10 | Restore all keys and switches to normal. | Minor alarm sounds.

B. Verification Test of Desired Lines—Using Maintenance Recorder

1 | Set up directory numbers on NM- switches designated OFF, TH, H, T, and U. | ET lamp extinguished.

    Note: One to five directory numbers, or ten with options Z, may be set up on NM-switches. Unused switches must be set to OFF.

2 | Operate proper MG- key. | Minor alarm silenced.

3 | Set LCH, LCT, LCU switches to agree with size of office served by marker group. | Maintenance recorder takes trouble record each time test circuit tests line location which matches one of directory numbers set up in Step 1.

4a | If tip party lines are to be tested—Operate TP key. | ET lamp lighted.

5 | Momentarily operate ST key. | Minor alarm sounds.

6b | If test circuit is to be stopped before end of test cycle—Operate STP key. | Test circuit stopped.

7b | Release STP key. | Test circuit resumes testing.

ET lamp lighted.
Minor alarm sounds.
## SECTION 216-805-502

### STEP ACTION

8. Momentarily operate AR key.  
   **VERIFICATION:** ET lamp extinguished.  
   Minor alarm silenced.

9. Restore all keys and switches to normal.

### C. Verification Test of Single Line—Using Maintenance Recorder

1. Set first NM- switches designated OFF, TH, H, T, and U to desired number.

2. Set all other NM- switches to OFF position.

3. Operate proper MG- key.

4a. If line to be tested is tip party—  
   Operate TP key.

5. Operate MSC key.

6. Operate and release VFS key until VF- lamps indicate desired file.  
   **Note:** If TP key is operated, it will require two operations of VFS key for each file advance.

7. Operate and release CHS key until CH- lamps indicate desired column hundreds.

8. Operate and release CTS key until CT- lamps indicate desired column tens.

9. Operate and release CUS key until CU- lamps indicate desired column units.

10. Operate and release SWS key until SW- lamps indicate desired switch.

11. Operate STP key.

12. Release MSC key.  
    **VERIFICATION:** Trouble record taken at maintenance recorder.  
    Test circuit stopped.

13b. If line is to be retested—  
    Momentarily operate RT key.  
    **VERIFICATION:** Trouble record taken at maintenance recorder.  
    Test circuit stopped.

    **VERIFICATION:** All lamps except ET extinguished.  
    Minor alarm sounds.

15. Momentarily operate AR key.  
    **VERIFICATION:** Minor alarm silenced.  
    ET lamp extinguished.

</tbody>
</table>

**5.02 KEYS**

<table>
<thead>
<tr>
<th>KEY</th>
<th>PURPOSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>AR</td>
<td><strong>Alarm Release:</strong> To release visual and audible alarms.</td>
</tr>
<tr>
<td>CHS</td>
<td><strong>Column Hundreds Step:</strong> To advance column hundreds during preselection of an individual line location.</td>
</tr>
<tr>
<td>CTS</td>
<td><strong>Column Tens Step:</strong> To advance column tens during preselection of an individual line location.</td>
</tr>
<tr>
<td>CUS</td>
<td><strong>Column Units Step:</strong> To advance column units during preselection of an individual line location.</td>
</tr>
<tr>
<td>RT</td>
<td><strong>Release:</strong> To restore the test circuit to normal.</td>
</tr>
<tr>
<td>RST</td>
<td><strong>Retest:</strong> To recycle the test circuit on the same line location.</td>
</tr>
<tr>
<td>ST</td>
<td><strong>Restart:</strong> To restart the test circuit after having locked in a lamp display on the test circuit lamps.</td>
</tr>
<tr>
<td>STP</td>
<td><strong>Start:</strong> To start the test circuit.</td>
</tr>
<tr>
<td></td>
<td><strong>Stop:</strong> To manually stop the test circuit.</td>
</tr>
</tbody>
</table>
SWS  
**Switch Set:** To advance the switch setting during preselection of an individual line selection.

TP  
**Tip Party:** To test tip parties.

VFS  
**Vertical File Set:** To advance vertical file during preselection of an individual line selection.

**5.03 LAMPS**

**LAMP**

**INDICATION**

CH-  
**Column Hundreds:** Indicates the column hundreds digit of the line location which is being passed to the transverter by the test circuit.

CT-  
**Column Tens:** Indicates the column tens digit of the line location which is being passed to the transverter by the test circuit.

CU-  
**Column Units:** Indicates the column units digit of the line location which is being passed to the transverter by the test circuit.

ET  
**End of Test:** Test circuit has completed a normal test cycle.

LC  
**Last Column:** Last column is being tested.

LV  
**Line Verification:** Line verification test was made but no trouble record could be made.

MBA  
**Make-Busy Auxiliary:** Transverter has been seized by the test circuit.

MRB  
**Maintenance Recorder Busy:** The test encountered the maintenance recorder plugged busy.

NM-  
**Number Match:** The translator has translated the line location into a directory number which matches the number set on the indicated NM- switches.

NT  
**Number Trapped:** A number match has been made with a maintenance recorder unavailable. The trapped number is displayed on NM- lamps and the corresponding line location is displayed on the CH-, CT-, CU-, VF-, and SW-lamps.

ON  
**OFF Normal:** The test circuit has started but has not completed a test cycle.

RP  
**Ring Party:** Ring party lines are being tested.

SW-  
**Switch:** Indicates the switch of the line location which is being passed to the transverter by the test circuit.

TP  
**Tip Party:** Tip party lines are being tested.

VF-  
**Vertical File:** Indicate the vertical file of the line location which is being passed to the transverter by the test circuit.
