BELL SYSTEM RESISTORS

1. INTRODUCTION

This is one of a series of Engineering Reference Data Bulletins containing information on apparatus designed by the Bell Telephone Laboratories, Incorporated for other than military applications, and manufactured by the Western Electric Company or by other suppliers in accordance with specifications prepared by the Laboratories. It is intended primarily for use by engineers of the Laboratories and contains information on apparatus which may be rated AT&TCo STANDARD, A&M Only, Component Part; codes classified ML except as noted; or codes designated for non-associate use. Codes rated Manufacture Discontinued and Component Part (ML) are not included.

Information given herein is intended to aid in development work. For any specific circuit arrangement, however, consideration should be given to the possible existence of new designs which may be smaller or less expensive, or may have more desirable characteristics.

TO OBTAIN THE LATEST INFORMATION AND COMPLETE CHARACTERISTICS FOR ANY APPLICATION, CONSULT THE COMPONENTS LABORATORY, RESISTORS GROUP.

All resistors contained in the bulletin are general use types, except those designated special use. Special use types are so described because they are highly specialized and of limited application. PREFERRED NUMBERS (Standard Resistance Values) are given in Table 1, page vii. These values should be used when specifying the desired value of resistance of Family Code type resistors. Resistance values should be limited, insofar as possible, to these PREFERRED NUMBERS because of manufacturing economies. For definitions and additional information concerning Family Codes, see 3.2.

2. CARD CATALOG RATINGS

It is planned to bring this bulletin up to date periodically. However, the information contained herein may not be complete and ratings of the items are not shown. Therefore, the final selection of apparatus should be made on the basis of the usual sources of information such as the Western Electric Apparatus Card Catalog, the manufacturing specifications, and price data. For information regarding the output of apparatus, refer to the Western Electric Report A-822.1.

The bulletin contains some codes of apparatus for which catalog cards will not be found in the Western Electric Apparatus Card Catalog. Such codes are in general rated "Component Part". This rating is applied to apparatus where it is believed that the associated companies will have no need for apparatus card catalog information and orders for the apparatus from the field are not expected.

When apparatus which is not listed on a white card in the Western Electric Apparatus Card Catalog is selected for use in new applications, the Head, Engineering Standards Department, Bell Telephone Laboratories, Incorporated, 463 West Street, New York 10014, N.Y. should be notified of the new use and probable demand so that consideration can be given to rerating the apparatus. When such new applications are made within the Laboratories, the selection should first be discussed with the Components Laboratory, Resistors Group.

3. DATA AND INDEX TABLES

Coded and KS-specification resistors are included in the bulletin. Two indices follow this introduction, (1) a numerical index by code type indicating whether the resistor is for General or Special use and in what section the code will be found, and (2) a numerical index of all codes and KS-specifications indicating the section, page, and where necessary, the line on the page on which the resistor data will be found.

Detailed information on the resistance values, mechanical form, dimensions, characteristics and circuit arrangements are given in the data tables.

3.1 Specific Resistance Codes

Data Tables are provided for coded resistors in which a specific code designation is assigned to a resistor having a specific resistance value (i.e. 19BA, 36A, etc.). The resistors are listed in these tables in the order of ascending values of resistance, to facilitate the selection of resistors for new applications. However, in several cases of resistors with more than one winding, the resistors are listed in alphabetical order of the code letter.

3.2 Family Codes

A Family Code applies where the resistor code number must be followed by a nominal resistance value to complete the description and ordering information. Family code specifications cover a range of resistance values rather than specifying an individual resistance value as in the specific resistance codes. The marking on the resistor includes the code number followed by its nominal resistance value in ohms, for example; "106A 100" or KS-8512L5 1000". Family codes are of two classes, as described below, RESTRICTED and NON-RESTRICTED.

3.21 Resistance Values

A family coded resistor may be obtained in any value within the range specified in its data table. However, effort shall be made to choose a resistance value and tolerance from Table 1, page vii, of STANDARD RESISTANCE VALUES in order to take advantage of manufacturing economies.

3.22 Restricted Family Codes

For restricted family codes, the nominal values of resistance in current production by the Western Electric Company are listed on its Western Electric Company Apparatus Card Catalog card under the headings PREFERRED and NON-PREFERRED. Wherever possible the engineer should specify the PREFERRED values. These values are in accordance with Table 1, page vii, of STANDARD RESISTANCE VALUES. The NON-PREFERRED values are those within the prescribed range of values for the code but not in accordance with the STANDARD RESISTANCE VALUES Table in either/or resistance or tolerance.

New values in accordance with STANDARD RESISTANCE VALUES Table will be added to the list of PREFERRED values on the card catalog card by the Western Electric Company Technical Publications Organization, Apparatus Card Catalog, upon written request from the engineer. The new value may then be used in specifications, drawings, and orders. New values will be added to the list of NON-PREFERRED values on the card catalog card by the Western Electric Company Technical Pub-

lications Organization, Apparatus Card Catalog, upon written request from the engineer. This request should contain the reasons for requiring the NON-PREFERRED value as well as drawing and specification references for the circuit application of the resistor. The new value should not be referred to in specifications, drawings, and orders until approval has been received from the Standards Engineering Coding Group. This procedure is also required for new applications of a NON-PREFERRED value already listed in the Western Electric Apparatus Card Catalog.

3.23 Non-Restricted Family Codes

For non-restricted family codes, the nominal values of resistance in current production by the Western Electric Company are not listed in the Western Electric Apparatus Card Catalog and the procedures necessary to restricted family codes do not apply. However, it is recommended that resistance values in agreement with the STANDARD RESISTANCE VALUES Table be specified for use with these codes wherever possible.

3.24 Family Codes - Wire Wound

Most of the family code-type wire wound resistors are in the PRECISION wire wound classification. These resistors are all available in $\pm 1\%$ tolerances and some are also available in tolerances as close as $\pm 0.1\%$ of nominal resistance value. Others are available in tolerances of $\pm 2\%$ and $\pm 5\%$ for use in applications for which closer tolerances are not required and a saving in manufacturing costs is desired. Precision resistors are distinguished from power resistors in wattage rating, resistor tolerance, size, and construction material, although there is some overlapping of precision and power resistors in all these features.

4. RESISTOR SELECTION AND APPLICATION GUIDE

The following recommended practices will contribute to reliability, standardization, and least cost in the application of resistors:

4.1 Resistance Values and Tolerances

4.1.1 Nominal resistance value for family coded resistors shall be selected from the STANDARD RESISTANCE VALUES Table, page vii. (See 4.12).

4.1.2 In the case of the following resistor types only, the nominal resistance value shall be selected from the industry tables of recommended values shown in the individual KS-specification:

<u>Carbon Composition Types</u>		<u>Wire Wound Types</u>
KS-13490	KS-16645	KS-13609
KS-13491		KS-13809
KS-13492		

4.1.3 Whenever possible, the broadest possible initial tolerance should be specified to achieve the lowest resistor cost.

4.2 Wattage and Derating Characteristics - Normal Operation

4.2.1 The wattage rating should never be exceeded (See 4.4.1). For operation at higher ambient temperatures, the maximum permissible power shall be decreased in accordance with the

specified power-temperature derating curve.

4.22 Maximum permissible power shall be reduced further if air flow is restricted by an enclosure, or if a number of resistors dissipating power are grouped together.

4.23 In critical applications where long term reliability and stability are essential, it is recommended that a resistor be selected such that its power rating is at least twice the power to be dissipated. This of course will result in a physically larger and more expensive resistor in most cases.

4.24 The vitreous enamel resistors of the KS varieties should be operated at 1/2 of their rated power to limit the surface temperature for personnel safety, or supplementary protection should be provided. When the option of reduced power is used, further reduction in accordance with 4.23 is not necessary.

4.25 The normal rating of the coded vitreous enamel resistors has been established to control the surface temperature for personnel safety. For this reason, further reduction of power dissipation in accordance with 4.23 is not necessary.

4.3 Wattage Characteristics - Trouble Conditions

4.31 The trouble wattage should not exceed twice the rated wattage. (The trouble wattage should not exceed the specified rated wattage in the case of the KS vitreous enamel resistors).

4.32 Some resistors, under high overload conditions, will burst into flame. If trouble conditions of this type cannot be avoided, spacing should be provided between the resistor and other flammable parts. This application should be brought to the attention of the Components Laboratory, Resistors Group.

4.4 Voltage Ratings

4.41 The maximum continuous voltage rating (DC or AC RMS) should never be exceeded, regardless of the voltage as calculated from the formula $E = \sqrt{RP}$, where R = Resistance in ohms and P = Power in watts.

4.42 For short duration pulse operation, it is recommended that the peak voltage exceed 2 times the rated continuous working voltage. (See 4.63).

4.5 Mounting of Resistors

4.51 Other components susceptible to heat damage shall be spaced away from heat producing resistors.

4.52 When voltages in excess of maximum DC or AC RMS values exist between the resistor and a conducting surface, supplementary insulation shall be provided to insure protection against breakdown.

4.53 Resistors larger than 1/2" in diameter or larger than 2" in length shall not be mounted on their terminal leads. Resistors shall never be mounted by their terminal lugs.

4.54 Resistor terminal leads shall never be bent closer than 1/16" from the resistor body.

- 4.55 The length of the resistor lead between the resistor body and point of application of solder shall be 1/2" nominal, 3/8" minimum. For critical applications where short lead lengths are essential, the problems should be discussed with the Components Laboratory, Resistors Group.
- 4.56 No finish should be applied over the resistor body after assembly into equipment in order to prevent possible damage to the resistive element, or deterioration of the finish due to resistor heat.

4.6 Selection and Application

- 4.61 Only coded or KS resistors should be specified on drawings for Bell System use.
- 4.62 New resistor types, available from outside suppliers, should be discussed with the Components Laboratory, Resistors Group prior to using in circuit applications.
- 4.63 Special applications or situations (temperature coefficient, frequency performance, ratings under pulse conditions, cost, stability, etc.) should be discussed with the Components Laboratory, Resistors Group.
- 4.64 It is suggested that all resistor applications in a new circuit or system be reviewed with the Components Laboratory, Resistors Group prior to final issuance of the manufacturing drawings.

NOTES:

1. The values given in this table have been chosen as standard for resistances having limits of $\pm 1\%$, $\pm 2\%$, $\pm 5\%$, and $\pm 10\%$ as indicated in the respective columns headed by these percentage figures.
2. The table gives the first three significant figures only and the decimal point should be placed as necessary, within the range specified for the desired type of resistor.
3. In the case of resistors with accuracy limits closer than $\pm 1\%$ it is recommended that nominal values for the first three significant figures be chosen to agree with the figures in the $\pm 1\%$ column of the table where practicable and that these nominal values be specified to not more than four significant figures.
4. Standard values significant figures 500 and 600 are limited to 50 and 600 ohms in $\pm 1\%$ tolerances. Other values whose first three significant figures are 500 and 600 (such as 500 ohms and 60 ohms) are not standard.

SPECIFIC CODE

II SPECIFIC CODE

DESCRIPTION

The resistors have one winding on a metal card. Heat resistant insulating material is used over the winding. The terminals and mounting stud pass through the mounting panel from which they are insulated by sleeves which are integral parts of the molded phenolic terminal head assembly. Terminals are tinned and are arranged for mechanically wrapped connections. Closest recommended mounting centers are $7/16$ inch by $1-3/4$ inches.

The power rating at 150°F ambient temperature is 5.1 watts for normal operating conditions and at 75°F , 12 watts for trouble conditions. They are derated to 0 watts at 250°F ambient temperature for normal conditions and 275°F ambient temperature for trouble conditions.

The maximum voltage across the resistor shall not exceed 350 volts.

DESCRIPTION

The resistors have two windings on a metal card, one winding superimposed on the other. Heat resistant material is used over the metal card, between the windings, and over the outer winding. The terminals and mounting stud pass through the mounting panel from which they are insulated by sleeves which are integral parts of the molded phenolic terminal head assembly. The mounting stud has an extension the same size and shape as the outer ends of the terminals and serves as a common terminal for the two windings. Terminals are tinned and are arranged for mechanically wrapped connections. The closest recommended mounting centers are $7/16$ inch by $1-3/4$ inch.

The power rating at 150°F ambient temperature is 5.1 watts for the two resistor sections in combination or 5 watts for either section provided that the other section is used at not more than $1/10$ watt. The corresponding rating for trouble conditions is 12 watts at 75°F . They are derated to 0 watts in an ambient temperature of 250°F for normal operating conditions and 275°F ambient temperature for trouble conditions.

The maximum voltage across the resistor shall not exceed 350 volts.

NOTES: (These notes apply to the tables following.)

- R. 5.1 watts maximum distributed over the two resistor sections in combination or 5 watts for either section provided that the other section is used at no more than $1/10$ watt.
- S. Normal power rating of the high resistance section is equal to the difference between the power dissipation in low resistance section, up to its normal power rating, and 5.1 watts.

ON THE FOLLOWING PAGES ALL 19-TYPE RESISTORS ARE LISTED IN ASCENDING NUMERICAL ORDER OF RESISTANCE VALUE OF EACH WINDING. THEREFORE, EACH RESISTOR IS LISTED TWICE.

DESCRIPTION

These are power type resistors in which the wire is wound on phenolized asbestos cards, and the windings are wrapped in a phenolized asbestos cover. They are component part resistors for which no provision is made for mounting. These resistors are suitable for assembling in a container with other components of approximately the same size. If used alone, mounting straps or devices may be required, depending on the use.

Power ratings given below are for continuous operation in an ambient of 150°F. The resistors are derated to 0 watts in an ambient of 250°F. When used in a container with or without other components, the power ratings do not apply.

CODE TYPE	TERMINALS	DIMENSIONS (Not Including Terminals)	RATING WATTS
92	7" lead wires	3-5/16" x 1-13/32" x 5/32"	2.5
120	7" lead wires	1-5/8" x 1-13/32" x 5/32"	1.0
123	lugs	3-7/8" x 1-3/8" x 11/64"	2.5

POWER RESISTORS - WIRE WOUND - CERAMIC CORES

VITREOUS ENAMEL INSULATION

Power resistors in code series fitting this description are tabulated below. Individual codes in these series have specific resistance values which fall within the resistance ranges shown. For example, the 44W resistor has a resistance value of $300 \pm 5\%$ ohms. The resistance ranges are not continuous between the minimum and maximum values shown. The minimum and maximum values do not necessarily represent extremes beyond which new designs could not be furnished.

CODE TYPE	APPROXIMATE NORMAL RATING (Note 1) WATTS	APPROXIMATE RESISTANCE RANGE OHMS	SECTION II PAGE
44	30	6 to 20000	41
59	15	24 to 3500	43
60	15	230 to 385	45
67	22	10 to 3000	47

91	15	400 to 1600	57
96	25	0.25 to 15.75	59
100	5	10 to 3200	61
119	25	100 to 1500	65

NOTE 1: The heat dissipating characteristics of these resistors are as follows:

Power Dissipation Condition	Wattage Rating of Resistor	Temperature Rise	Ambient Temperature
Normal Condition	Normal Rating	250° F	77° F
Trouble Condition	2 x Normal Rating	450° F	77° F

Ceramic Core, Enamel Insulation - 44-TYPE RESISTOR

DESCRIPTION

Power rating is 30 watts for continuous operation at 77° F ambient temperature.

Provided with a stud and nuts for mounting. Closest recommended mounting centers are 1 inch by 1-1/2 inches.

Single winding resistors.

30	44AK	20000.0	2

DESCRIPTION

Power rating is 15 watts for continuous operation at 77° F ambient temperature.

Arranged for mounting on mounting plates. Will mount on 7/8 inch horizontal centers and 1-5/16 inch vertical centers. Except for horizontal centers, will mount on panels drilled for 19-type resistors.

Single winding resistors.

18	59A	3000.0	5
19	59B	3500.0	5

DESCRIPTION

Has two windings and three terminals, one terminal being common to both windings. Terminals for Windings A and B are arranged as shown in Fig. 1.

Arranged for mounting on mounting plates. Will mount on $7/8$ inch horizontal centers and $1-3/4$ inch vertical centers. Except for horizontal centers, will mount interchangeably with 19-type resistors.

Power ratings indicated in the table are for continuous operation at 77° F ambient temperature.

DESCRIPTION

-Power rating is 22 watts for continuous operation at 77° F ambient temperature.

Will mount on 3/4 inch horizontal centers and 1 inch vertical centers. Intended to be mounted on 4-type resistor mounting. Has one soldering terminal, the other connection being made through the 4-type resistor mounting.

2	71B	60	5

Ceramic Core, Enamel Insulation - 82-TYPE RESISTOR

DESCRIPTION

Power rating is 7.5 watts for continuous operation at 77° F ambient temperature. For each degree F that the ambient exceeds 77° F, the power rating decreases 0.4%.

Closest recommended mounting centers are 1-3/8 inches by 1-1/8 inches.

Single winding resistor.

6	82C	500	1
7	82E	700	5

DESCRIPTION

Power rating is 6.0 watts for continuous operation at 77° F ambient temperature.

Equipped with two flexible leads. May be mounted on a threaded stud through the center of the resistor.

Closest recommended mounting centers are 7/8 inch by 7/8 inch.

Single winding resistor.

Ceramic Core, Enamel Insulation - 85-TYPE RESISTOR

DESCRIPTION

Power rating is 20 watts for continuous operation at 77° F ambient temperature.

Closest recommended mounting centers are 1-3/8 inches by 1-7/8 inches.

Single winding resistor.

Line No.	CODE NO.	NOMINAL RESISTANCE OHMS	TOLERANCE %
1	85D	220	5
2	85C	13000	5

DESCRIPTION

Has three windings connected in series. Equipped with four flexible leads, one at each end and one at each winding junction. Power rating is 15 watts for continuous operation at 77° F ambient temperature. Resistance values do not vary more than $\pm 5\%$.

May be mounted on a threaded stud through the center of the resistor.

Closest recommended mounting centers are 1-1/8 inch by 1-1/8 inch.

CODE NO.	WINDING A NOMINAL RESISTANCE OHMS	WINDING B NOMINAL RESISTANCE OHMS	WINDING C NOMINAL RESISTANCE OHMS
91A	400	600	600

DESCRIPTION

Has six windings consecutively connected in series and is provided with a tap at each winding junction. Equipped with a medium lamp base. Intended for use interchangeably with ballast lamps where voltage regulation permits. Power rating is 25 watts for continuous operation at 77° F ambient temperature.

CODE NO.	WINDING STARTING NEXT TO EDISON BASE	NOMINAL RESISTANCE OHMS	TOLERANCE %

	3rd	1.00	5
	4th	2.00	5
	5th	4.00	5
	6th	8.00	5

DESCRIPTION

Have one or more windings, as indicated. Windings are connected in series and taps are provided at the winding junctions. Power rating is 5 watts for continuous operation at 77° F ambient temperature.

Can be mounted by means of a 9A or 9B resistor mounting. Closest recommended mounting centers are 1-3/8 inch by 1 inch.

Axial Leads - 234 & 235 Type RESISTOR

DESCRIPTION

These resistors consist of a winding of resistance wire over a core of insulating material enveloped in a protective sleeve of colored polyethylene. The color identifies each particular combination of nominal resistance and tolerance. They are provided with tinned axial leads.

Power rating is 0.5 watt for 234 type and 1.0 watt for 235 type at 60°C (140°F) ambient temperature. For each degree centigrade that the ambient exceeds 60°C, the power rating decreases approximately 2-1/4 per cent.

21	235G	5110	5161	5059	Green	1.000

* Has a nominal temperature coefficient of 6000ppm/°C.

DESCRIPTION

Wire-wound resistor consisting of an inductive winding on a core of insulating material and covered with plastic tubing. Equipped with axial tinned leads.

Has a special temperature coefficient of $+500 \pm 50$ ppm/ $^{\circ}\text{C}$.

Power rating is 1.0 watt at 60°C (140°F) ambient temperature. For each degree C that the ambient exceeds 60°C , the power rating decreases approximately $2\frac{1}{4}$ per cent.

Resistance value is $562 \pm 1\%$ ohms.

WIRE WOUND RESISTORS - FAMILY CODES

1. 64- and 65-type resistors differ in method of winding. For minimum phase angle in the resistance range of 1 to 200 ohms use 64-type and for resistance ranges above 200 ohms use 65-type.
2. Ratings in Watts:

1 to 2 ohms	0.1 watt
2 to 10 ohms	0.25 watt
10 to 13000 ohms	1.0 watt
3. 106B resistor not recommended for general use above 12000 ohms because of high temperature coefficient of resistance.
4. Not recommended for general use above 90000 ohms because of high temperature coefficient of resistance.
5. Ratings in Watts:

0 to 60 ohms	0.25 watt
60 to 14990 ohms	0.375 watt
15000 to 29990 ohms	0.50 watt
30000 to 59990 ohms	0.75 watt
60000 to 89990 ohms	1.0 watt
90000 to 149900 ohms	0.75 watt
150000 to 250000 ohms	1.0 watt
6. Wattage rating decreases 1% for each degree F that the ambient temperature exceeds 150° F.
7. Resistor is inductively wound.
8. Wattage rating decreases approximately 1.8% for each degree F that the ambient temperature exceeds 150° F.
9. Bifilar winding.
10. Low time constant.
11. Ratings in Watts:

4990 to 14900 ohms	0.375 watt
15000 to 29800 ohms	0.50 watt
30100 to 59700 ohms	0.75 watt
60400 to 80600 ohms	1.0 watt
12. Rating in watts for trouble condition is two times normal rating.
13. Single layer unidirectional winding on a phenolic fiber tube covered with Vincellatate muslin. Winding terminates in two flexible axial insulated leads.
14. Multilayer unidirectional winding covered with Vincellatate muslin. Winding terminates in two flexible axial insulated leads.
15. Inductive single layer winding on spool having brass core and phenolic spool heads. Covered with Vincellatate muslin.
16. Wattage rating decreases approximately 2-1/4% for each degree C that the ambient temperature exceeds 60°C (140° F).
17. Conformal coating of plastic.
18. Ratings in Watts:

4990 to 12490 ohms	0.25 watt
12500 to 24990 ohms	0.50 watt
25000 to 49900 ohms	0.75 watt
50000 to 89900 ohms	1.0 watt
90000 to 149000 ohms	0.75 watt
150000 to 250000 ohms	1.0 watt
19. Has positive temperature coefficient of 140±30 ppm/°C and low reactance, making the resistor suitable for use at high frequencies.
20. Has a positive temperature coefficient of resistance of 5190±270 ppm/°C.
21. Has a positive temperature coefficient of resistance of 5200±300 ppm/°C.
22. Ratings in Watts:

340 to 2670 ohms	0.375 watt
2740 to 5360 ohms	0.50 watt
5490 to 10700 ohms	0.75 watt
11000 to 16200 ohms	1.00 watt
23. Has a positive temperature coefficient of resistance of 3500 ppm/°C.
24. Wattage rating decreases 1-1/4% for each degree F that the ambient temperature exceeds 170° F. Trouble wattage rating decreases 0.8% for each degree F that the ambient temperature exceeds 150° F.

* Refer to this figure for general outline only. For construction, See Notes 13 and 14, Page III-6, for 136- and 137-types respectively.

(a) Resistors within range of 0.1 to 3.83 ohms have max. diameter of 0.283 inches. All others have max. diameter of 0.250 inch.

138-Type Resistors

DESCRIPTION

These resistors consist essentially of a ceramic core having a coating of deposited carbon. See the figures on the following pages identified by code designations for dimensions, leads, terminals, and mounting information.

RESISTANCE VALUE

See data table on following page for resistance range and TABLE 1, Page vii in the Introduction for standard resistance values.

RESISTANCE TOLERANCES

In general, the tolerances expressed are $\pm$ values as tabulated. The 222A and 223B resistors, in addition to overall tolerances of $\pm 1\%$, have distribution requirements and when ordered in quantity are packaged in groups of five. The resistors in each group of five have resistance values substantially evenly distributed above and below the nominal resistance value ordered and are within the $\pm 1\%$ tolerance limits. When less than five resistors are ordered, the resistors furnished have values within the $\pm 1\%$ tolerance limits. The groups of five resistors are divided into three cells as specified in the table and Note 13, Page III-14.

CHARACTERISTICS

The column headed "Characteristics" is used where special qualities, limitations, or requirements apply.

DEPOSITED CARBON RESISTORS - FAMILY CODES

NOTES:

1. For each degree that the ambient exceeds 30° C the power rating decreases about 1%.
2. While under rated power load, the resistor decreases about 2-1/2 per cent in resistance value.
3. Baked enamel.
4. Insulating sleeve.
5. While under rated power load, the resistor decreases about 2% in resistance value.
6. While under rated power load, the resistor decreases about 3% in resistance value.
7. Ceramic shell - hermetically sealed.
8. For each degree that the ambient exceeds 40° C the power rating decreases 1-1/4%.
9. While under rated power load, the resistor decreases about 1-1/4 per cent in resistance value.
10. Varnish finish - requires special packing for shipment.
11. Enclosed in a glass envelope containing an inert gas at approximately 1/3 atmospheric pressure.
12. For each degree that the ambient exceeds 30° C the power rating decreases about 0.5%.
13. When less than 5 resistors are ordered, the tolerance is ±1%.
When ordered in quantity, the resistors are furnished in groups of 5, the ±1% tolerance range is divided into 3 cells as follows:

	<u>Upper Limit</u>	<u>Lower Limit</u>	<u>Resistors* Per Cell</u>
Upper Cell	1.0%	0.30%	1
Center Cell	0.35%	- 0.35%	3
Lower Cell	- 0.30%	- 1.00%	1

*At manufacturers discretion, all 5 may be in the center cell.

NOTE: Resistors in the range of +0.35% to +0.30% are considered to be either in the upper or center cell. Resistors in the range of -0.30% to - 0.35% are considered to be either in the lower or center cell.

14. Max. voltage 700 volts DC or RMS 60 cycle.
15. Max. voltage 350 volts DC or RMS 60 cycle.

DEPOSITED CARBON RESISTORS - FAMILY CODES

NOTES:

16. Max. voltage 300 volts DC or RMS 60 cycles.
17. Free air convection at 40° C.
18. For each degree that the ambient exceeds 40° C the power rating decreases about 0.6%.
19. The 149A and 149B resistors differ in that the resistance values and tolerance requirements apply when the 149A is measured in a No. 9A Attenuator, or equivalent, and the 149B is measured in a KS-9534L2 Attenuator, or equivalent.
20. Resistance values available and corresponding tolerances are shown in the following table:

Resistance-Ohms			Tolerance
Range		Steps	
0.300 to	19.999	0.001	+(0.75% +0.002 ohm) -(1.00% +0.002 ohm)
20.000 to	99.990	0.01	+0.75% -1.00%
100.000 to	300.000	0.1	+0.75% -1.00%
300.100 to	1000.000	0.1	+0.0025 R% * -0.0033 R% *

* R is the nominal resistance value of the resistor in ohms.

21. The 150A resistor is intended to be assembled with a 149A resistor at its center point.
 22. Resistance values available and corresponding tolerances are shown in the following table:
- | Resistance-Ohms | | Tolerance |
|-------------------|-------|--------------------|
| Range | Steps | |
| Zero (metal core) | --- | +0.002 ohm max. |
| 1.000 to 19.999 | 0.001 | +(0.5% +0.002 ohm) |
| 20.000 to 100.000 | 0.01 | +(0.5% +0.002 ohm) |
23. Zero nominal resistance value is provided by use of a metal rod in place of the resistor unit. The resistance in this case is specified as 0.002 ohm max.
 24. The nominal resistance values are provided to any desired tolerance but not smaller than $\pm 0.5\%$.
 25. Infinite resistance value is provided by omitting the carbon coating and the electrodes from the ceramic disc. The resistance in this case is specified as "Infinite".
 26. The nominal resistance values are provided to any desired tolerance but not smaller than $+(0.5\% +0.001R)\%$. R is the nominal resistance value of the resistor in ohms.
 27. -520 (Max. Temperature Coefficient of Resistance PPM/°C).
 28. -500 (Max. Temperature Coefficient of Resistance PPM/°C).
 29. -450 (Max. Temperature Coefficient of Resistance PPM/°C).

DEPOSITED CARBON RESISTORS - FAMILY CODES

30. -390 (Max. Temperature Coefficient of Resistance PPM/°C).
31. -300 (Max. Temperature Coefficient of Resistance PPM/°C).
32. Maximum temperature coefficient of resistance versus resistance range is as follows:

Resistance Range	Temperature Coefficient PPM/°C
50.0 ohms to 1.0 meg.	-450
1.01 meg. to 10.0 meg.	-495
10.10 meg. to 30.0 meg.	-540
30.10 meg. to 50.0 meg.	-800

33. Temperature coefficient of resistance is maximum -370 PPM/°C, minimum -270 PPM/°C.
34. For each degree that the ambient temperature exceeds 70°C, the power decreases approximately 1-1/4%.
35. Intended for general use where they will not be subjected to relative humidity in excess of 60% for prolonged periods.
36. Has a negative temperature coefficient of resistance of 0.03% per °C.
37. When operated within this wattage and temperature rating, these resistors are not expected to change downward by more than 2% nor upward by more than 4% in resistance value.
38. When operated in ambient temperatures above 70°C, the power rating is derated linearly to 0.125 watt at 125°C and to zero power at 150°C.
39. Intended for general use where humid conditions may be encountered. Encased in a moisture resistant epoxy shell.
40. When operated in ambient temperatures above 70°C, the power rating is reduced linearly to zero at 150°C.
41. This resistor consists of a pair of 145C resistors, each having the same nominal resistance value and matched to that resistance value to within 1 per cent at 75°±5° F.

222-Type Resistors

DEPOSITED CARBON RESISTORS - 218-TYPE RESISTOR

DESCRIPTION

The 218-type resistor consists of a ceramic core having a coating of deposited carbon, and an electrode at each end. One end of the resistor unit is assembled in a ferrule arranged for mounting in the wall of a wave guide.

The resistor is capable of dissipating 0.5 watt. Where the resistor tolerance is less than 3%, allowance should be made for change in resistance due to application of load to the resistor, due to the temperature coefficient of maximum $-450 \text{ PPM}/^{\circ}\text{C}$, average $-300 \text{ PPM}/^{\circ}\text{C}$.

Overall dimensions are $1-1/8"$ long by $1/4"$ diameter. The diameter of the portion of the ferrule which enters the mounting hole is $0.145" +.000 - .002"$.

They are used in the TH Radio System, and in these applications the power dissipation is approximately 0.1 watt.

CODE NO.	RESISTANCE OHMS	TOLERANCE %
218A	100	1
218B	157	2
218C	100	3

DESCRIPTION

The 226A resistor consists of a pair of 221A resistors, 75 ohms each matched so that the final resistance values do not differ from each other by more than 0.5% (or 0.37 ohm) when measured at 25° C. The maximum differences in temperature coefficients of resistance is 100 PPM/°C, and the maximum temperature coefficient of resistance is -500 PPM/°C.

Each component resistor has body dimensions (including insulating tube) of 5/8 inch long by 7/32 inch diameter and has two axial leads each 1-1/2 inch long and 0.026 inch in diameter.

Each 226A resistor is packaged as a single pair of resistors when furnished to the customer. Each component of the pair is stamped with the code marking "226A", instead of 221A, and the resistance marking is 75.

The maximum power rating is 0.10 watt, or 0.05 watt for each component of the pair.

It is used in the 489A network in the TA Radio System.

DESCRIPTION

These resistors consist of a tantalum film on a ceramic substrate with co-planar leads of 0.025 inch diameter tinned copper wire.

They are capable of dissipating 0.125 watt at 70° C and are derated to zero power at 125° C. The temperature coefficient of resistance is -100 ± 50 PPM/°C.

The resistors are available in a resistance range of 100 ohms to 0.1 meg.

<u>Code</u>	<u>Tolerance</u>	Available in standard resistance values listed in these columns of STANDARD RESISTANCE VALUES, Table 1	
254A	$\pm 1\%$		$\pm 2\%$
254C	$\pm 5\%$		$\pm 10\%$
254J	$\pm 3\%$		$\pm 5\%$

DESCRIPTION

These resistors are precision wire wound resistors having extremely low parasitics of inductance.

They consist of a bifilar loop of resistance wire of appropriate length, wound on a glass bonded mica winding form with axial leads at each end.

Code No.	DC Resistance - Ohms			Inductance - UH	
	Max	Nom	Min	Max	Min
246B	1.917	1.870	1.823	0.055	0.045

246D	4.649	4.580	4.511	0.060	0.050

GENERAL

The KS- specification resistors listed are those having the most general use. Other KS- specification resistors are not included because of their very special use or because they are approaching obsolescence.

For some resistors, the maximum voltage which may be applied across the terminals of the resistor is specified. A term associated with this requirement is "Critical Resistance Value". This is defined as the value of resistance for which the voltage required to produce rated power dissipation in the resistor is equal to the maximum voltage rating. Below the critical resistance value the wattage rating limits the applied voltage and above the critical resistance value the maximum voltage rating limits the power dissipation. Where the critical resistance value is beyond the range of available resistance values, the maximum voltage the resistor could withstand is not specified.

Temperature coefficient of resistance information is furnished in notes to which reference is made in the tables under the heading of "Characteristics". In adjustable resistors, good contact must be made between the adjusting device and the winding for the temperature coefficient of the resistor to be dependable. The notes indicate whether the requirement is contained in the specification for the resistor or the specification used for the material used in its construction by calling the requirement "resistor requirement" or "material requirement", respectively.

KS- SPECIFICATION RESISTORS - WIRE WOUND

NOTES:

1. For applications in which the high surface temperature of these resistors may introduce a personnel hazard in the telephone plant when used at rated wattages, it is recommended that resistors be used such that the power load does not exceed 50% of the rating shown in the table.
2. For multi-winding or tapped winding resistors, the total allowable wattage dissipation shall be reduced by the amount equivalent to the reduction in winding space effected by the additional terminals.
3. See the special table for KS-8512 resistors on page IV-4 showing list numbers and their individual resistance ranges, ratings in watts, and dimensions.
4. The wattage rating in the table applies for the entire winding. The watts dissipated in any section resulting from the location of adjusting bands shall not exceed the proportion determined from the following formula:

$$\text{Watts (section)} = \frac{\text{Resistance of section}}{\text{Res. of entire winding}} \times \frac{\text{Resistor Rating}}{\text{in Watts}}$$

5. Only the following nominal values of resistance are available under specification KS-13809:

<u>List No.</u>	<u>Resistance - Megohms</u>
1	3.5, 4.0, 5.0, 6.0
2	1.0, 1.5, 2.0, 2.5, 3.0, 3.5
3	0.5, 0.8, 1.0

The resistance value in megohms, the power rating in watts, and the maximum rating in kilovolts are numerically equal, that is, a resistor per KS-13809L1 having a nominal resistance value of 3.5 megohms has a power rating of 3.5 watts and a maximum voltage rating of 3.5 KV.

6. The maximum voltages to be applied across the resistors are numerically equal in KV to the resistance in megohms, that is, the maximum voltage of the 3.5 megohm resistor is 3.5 KV.
7. This resistor is rectangular in shape.

	<u>Temp. Coefficient of Res.</u>	<u>Material or Resistor Requirement</u>
8.	Max. +200 ppm/°C	Resistor Requirement
9.	+ 300 ppm/°C - 50 ppm/°C	Material Requirement
10.	Max. +150 ppm/°C	Material Requirement
11.	Max. +300 ppm/°C	Material Requirement
12.	(1 to 10 ohms) ±650 ppm/°C (More than 10 ohms) ±300 ppm/°C	Resistor Requirement
13.	Max. +130 ppm/°F or ± 20 ppm/°F as specified in order	Resistor Requirement

NOTES: (Contd.)

	<u>Temp. Coefficient of Res.</u>	<u>Material or Resistor Requirement</u>
14.	+260 ppm/°C to +1400 ppm/°C at high and low resistance ranges respectively.	Resistor Requirement
15.	Resistor is marked with EIA color code as illustrated on page IV-22 to indicate nominal resistance in ohms and tolerance. See Table 2, page IV-22 for nominal resistance values and tolerances in which the resistance values are available (EIA Preferred Number System), and Table 3, page IV-22 for color code.	
16.	See Table 5, page IV-24 for nominal resistance values available.	
17.	NOT RECOMMENDED for general use. Components Laboratory, Resistor Development Group should be consulted for new applications.	
18.	Temperature coefficient of resistance is as follows:	
	L1, L2, L3, L4	±30 ppm/°C
	L5	±15 ppm/°C
	L6	±20 ppm/°C
19.	Temperature coefficient of resistance is ±30 ppm/°C.	
20.	Low inductance.	
21.	L1 has taps provided at 0.05, 0.15, 0.35, and 0.75 ohms. It is designed for a maximum current of 11 amperes. L2 has taps provided at 0.2, 0.6, and 1.4 ohms. It is designed for maximum current of 5.5 amperes. Wattage rating is based on maximum resistance.	
22.	Temperature coefficient of resistance for L2 and L5 is ±50 ppm/°C. All other lists are ±150 ppm/°C.	
23.	Inductance for L1 is 1.80 max., 1.40 min.; for L2 is 1.85 max., 1.45 min.	
24.	Has maximum series inductance of 0.7 uh.

+105°C	±8%	±10%

6. Typical limiting frequencies above which a decrease of more than 10% from DC resistance value can be expected.

<u>Nominal Resistance Value</u>	<u>Approx. Max. Frequency for -10% Change</u>
10000 ohms	10 MC
0.1 meg	1 MC
1 meg	100 KC
10 meg	10 KC

7. Resistor is marked with EIA color code as illustrated on page IV-23 to indicate nominal resistance in ohms, and tolerances. See Table 4, page IV-23 for nominal resistance values and tolerances in which the resistance values are available (EIA Preferred Numbers System), and Table 3, page IV-22 for the color code.
8. High reliability. It is intended that the failure rate will be less than 15 failure units per 1000 hours when operated at 50% of the rated power at 25°C.
9. Temperature coefficient of resistance is +7000 ppm/°C.

KS- SPECIFICATION RESISTORS - DEPOSITED CARBON, METAL, OR METAL OXIDE

NOTES:

- | | <u>Max. Voltage Rating</u> | <u>Critical Resistance Value</u> |
|----|----------------------------|----------------------------------|
| 1. | 200 volts | |
| 2. | 250 volts | 500000 ohms |
| 3. | 300 volts | 360000 ohms |
| 4. | 350 volts | 250000 ohms |
| 5. | 500 volts | 250000 ohms |
| 6. | 750 volts | 281000 ohms |
7. KS-16311 to KS-16314 resistors, inclusive, may be mounted by their lead wires. Mounting straps are recommended for use in mounting the KS-16315 resistors.
8. Temperature coefficient of resistance is as follows:
- | | |
|--------------|-----------------------------|
| List 1 and 2 | ± 500 ppm/ $^{\circ}$ C |
| List 3 | ± 250 ppm/ $^{\circ}$ C |
| List 4 | ± 50 ppm/ $^{\circ}$ C |
| List 5 | ± 25 ppm/ $^{\circ}$ C |
| List 6 | ± 100 ppm/ $^{\circ}$ C |
9. Add suffix as follows to the list number for tolerance:
- | | |
|---------------|---------------------|
| A $\pm 1\%$ | Lists 1, 3, 4, 5, 6 |
| B $\pm 2\%$ | Lists 3, 4, 5, 6 |
| C $\pm 5\%$ | Lists 1, 3, 4, 5, 6 |
| D $\pm 1/2\%$ | Lists 4, 5, 6 |
| E $\pm 1/4\%$ | Lists 3, 4, 5, 6 |
| F $\pm 0.1\%$ | Lists 4, 5, 6 |

NOTES:

1. Temperature coefficient of resistance is as follows:

List 1 ±100 ppm/°C

List 2 ±50 ppm/°C

List 3 ±25 ppm/°C

2. NOT RECOMMENDED for general use. Components Laboratory, Resistor Development Group should be consulted for any new use. Consists of a group of seven resistors closely interrelated with respect to specific ratios of resistance values.

3. Add suffix as follows to the list number for tolerance:

A ±1% Lists 1, 2, 3

D ±1/2% Lists 1, 2, 3

E ±1/4% Lists 2, 3

4. Maximum temperature coefficient of resistance is +375 ppm/°C.

5. Resistor should not be used in an ambient greater than 150°C.

✓ SPECIFIC CODE

DESCRIPTION

The 36-type resistors are precision wire wound on a spool having a brass core and phenol fiber spoolheads. They are mounted by a screw which passes through a $3/16$ inch diameter hole in the core. The spool is $7/8$ inch high and the diameter including the terminals is $1-3/8$ inches. The closest recommended mounting centers are $1-5/8$ inches by $1-5/8$ inches.

Most of the 36-type resistors are used to provide attenuation and those so used have attenuation and terminal impedances listed in the tables following. The figures listed in the table under "Fig. No." show the relative positions of the resistor windings and the terminal impedances.

The power rating for the entire resistor is 1.5 watts for continuous operation in an ambient of 100° F.

FOR SCHEMATIC FIGURES SEE PAGES V-4 and V-5.

DESCRIPTION

The 40-type resistors are wound non-inductively on an iron core of the punched flat type similar to that of the "E" type relays. They mount interchangeably with the "E" type relays. These resistors are 1-3/8 inch wide and 11/16 inch thick, 3-15/64 inch high from mounting surface to top. Their terminals extend 3/4 inch beyond the mounting surface. The resistors mount on 1-3/4 inch vertical centers and on horizontal centers as shown in the following tables.

The resistance tolerances are $\pm 5\%$ except as shown otherwise in the tables.

The power rating of the entire resistor is 4.6 watts.

DESCRIPTION

Non-inductive resistors wound on a spool. The power rating is 1 watt in free air and 2 watts when mounted singly on metal plates in an ambient of 150° F. The corresponding ratings for trouble conditions are 2 and 4 watts respectively. The maximum continuous operating temperature of the resistor surface is 250° F.

Can be mounted on No. 930- or similar type mounting plates or in the drillings for No. 221- or similar type relays. Can also be mounted in a separate drilling by means of a screw which passes through the core of the resistor. The screw is furnished with the mounting plate and can be obtained of sufficient length to mount either 1, 2, 3, or 4 resistors, one over the other in the same plate position.

The closest recommended mounting centers are 1-1/8 inch by 1-1/8 inch.

* Has a relatively high temperature coefficient of resistance.

DESCRIPTION

These are spool type resistors, non-inductively wound in the manner indicated in the tables. Where space permits, these resistors are recommended in place of the 64- and 65-type resistors. For minimum phase angle, use bifilar wound resistors between 1 and 200 ohms and reverse layer wound resistors above 200 ohms.

Mount on $7/8$ inch vertical centers and $7/16$ inch horizontal centers.

The power rating is 1 watt in an ambient of 150° F. For each degree F that the ambient exceeds 150° F, the power rating shall decrease 1%.

DESCRIPTION

These are spool type resistors, inductively wound.

They mount on 1 inch vertical centers and 5/8 inch horizontal centers.

The power rating is 1 watt in an ambient of 150° F. For each degree F that the ambient exceeds 150° F, the power rating shall decrease 1%.

Resistance values are held within limits of $\pm 1\%$.

CODE NO.	NOMINAL RESISTANCE OHMS
105A	120000
105B	78000

DESCRIPTION

These resistors are wound on a phenol plastic spool having four terminals. The end terminals are bent to facilitate connection to bus bars to provide voltages as required by individual circuits. Several types of windings are used as indicated in the table headings on the following pages, to minimize inductance and capacitance in the windings to the degree required by circuit applications.

The dimensions vary depending upon the fullness of the windings, as indicated in the tables under the column headings "Fig. No." and "Dimension D".

The power rating of the resistor at an ambient of 77° F is 1 watt total for windings A and B and 1-1/4 watts total for windings A, B, and C. Trouble ratings are double the normal rating.

These resistors are used in supply circuits in Type J, K, and L Carrier Telephone Systems.

DESCRIPTION

These resistors are wound on steatite cores having four winding sections and are equipped with 6 inch flexible leads. They are used as components of filters, equalizers, and networks. They have inductive or non-inductive windings as indicated in the following tables. The non-inductive resistors have bifilar or reverse layer windings. The winding arrangements are shown in the circuit diagrams in which the letters "A", "B", "C", and "D" are designations of windings most of which have only one external lead connection.

The body dimensions are 1 inch long by 1/2 inch diameter. The resistor has a 1/8 inch diameter hole in the core for mounting.

DESCRIPTION

These resistors are wound in multi-section ceramic spools and are covered with textile insulation. The 102-type resistors have flexible lead wires which vary in length from code to code. The 104-type resistors have flexible leads of minimum 6 inches in length. The 115-type resistors have three solid tinned lead wires extending from the "Winding B" end of the spool, located within a 180° arc. With the middle terminal of the 115-type uppermost, Winding A is connected to the right hand and middle terminals and Winding B is connected to the left hand and middle terminals.

These resistors are used as components in potentiometers, filters, equalizers, networks, transformers and repeaters in carrier telephone systems.

The resistors are approximately 1-3/4 inches long by 1/2 inch to 9/16 inch diameter depending on fullness of winding and insulation. The 104- and 115-type resistors have a hole through the center of the spool which will clear a 0.101 inch rod, and the hole has a .138-32 thread 3/16 inch deep at one end for mounting. Other means of mounting must be provided for the 102-type resistors which are completely covered with insulation and asphalt compound.

115-Type Resistor

DESCRIPTION

These resistors are non-inductively wound on ceramic spools. They are for use in rheostats in impedance bridges. The outer ends of the 212A resistor are left open for future adjustment. The outer ends of the other 212-, 213-, and 214-type resistors are spliced and soldered.

The overall dimensions of each 212- and 213-type resistors and each component 214-type resistor are approximately 1-3/4 inch long by 3/8 inch diameter. The tinned terminal leads extend approximately 2 inches from one end of the resistor.

Each 214A resistor is packaged as a single pair of resistors when furnished to the customer.

CODE NO.	Description & NOMINAL RESISTANCE OHMS	TOLERANCE %
214A	Consists of a PAIR OF 213C RESISTORS, 1000 ohms each	Final resistance values should not differ from each other by more than 0.05% (or 0.5 ohm) when measured at 20° C

DESCRIPTION

These resistors are inductively wound, using mandrellated 0.001 inch diameter enameled copper-nickel resistance wire such as Advance wire. They are enclosed and sealed in phenol fabric tubes. The windings are wound on a mandrel which is removed when the windings are inserted in the tubes.

The 128A resistor is 1 inch long by 1/2 inch diameter and is provided with two terminal pins.

The 129A resistor is 1-1/4 inch long by 1/2 inch diameter and is provided with three terminal pins.

In both resistors, the dimension from the free end of the terminals to the diametrically opposite surface of the resistor is 25/32 inch.

These resistors are end mounted by means of a fiber screw 1/4 inch long by 1/4 inch diameter. The screw is furnished with the resistor.

The resistors are used in line amplifiers in the Type L Carrier Telephone System.

	2 - 3	1750	5	0 to -3.0

* Not marked on 128A - for reference only.

DESCRIPTION

The resistor is wound on an insulated cylindrical aluminum core. It is provided with seven lug-type terminals, one of which is not connected to the windings, but is used for separate wiring connection in the apparatus of which this resistor is a component.

The resistor is inductively wound. Windings A, B, C, D, and E are wound consecutively and are connected in series. The terminal which is not connected to the winding is at the end of the core, and the outer end of winding A is connected to the adjacent terminal.

The resistor is used in the 18A thermistor in the J86213A regulated disc type rectifier. The current through the resistor is approximately 0.030 amperes.

The overall dimensions, not including terminals, are 3-1/4 inches long by 23/32 inch diameter. The terminals are in axial alignment and extend radially 7/16 inch from the resistor surface.

The core is provided with a tapped hole 1/4-28 by 11/32 inch at each end for mounting.

DESCRIPTIONRESISTORS HAVING SPECIAL RESISTANCE-TEMPERATURE CHARACTERISTICS124A RESISTOR

This resistor is inductively wound with pure nickel wire on a core of insulating material. A material requirement for temperature coefficient of resistance specified for the wire in ppm/°C is maximum 6500, minimum 5800.

The resistor is designed for maximum current of 0.060 ampere. It is used in the J86212A regulated rectifier.

The dimensions are 3-9/16 inch long by 17/32 diameter by 7/8 inch over diametrically opposite ends of terminals. A 5/8 inch long by 1/4 inch diameter screw of insulating material is furnished for mounting.

224-TYPE RESISTORS

The 224A resistor has a low reactance (bifilar) winding on a phenolic core and is suitable for use at high frequencies. The 224B resistor has an inductive winding on a phenolic core and is not suitable for use at high frequencies. They are enclosed in a phenolic tubular shell. The resistors are equipped with 0.026 inch diameter tinned axial leads which extend approximately 2 inches from each end of the body. They may be supported from these leads. The body dimensions are 1 inch long by 21/64 inch diameter.

These resistors are wound with pure nickel wire. The temperature coefficient of resistance is specified as a requirement on the completed resistor and in ppm/°C is maximum 6500, minimum 5000.

The 224A resistor is used in the J68372D Limiter-Discriminator in TJ Radio. The normal operating voltage in this application is 0.7 volts. The voltage developed across the resistor provides a temperature compensating bias for clipper diodes in a limiter circuit. For satisfactory performance in this respect rather than heat dissipating capability, the power rating is limited to 0.01 watt.

The 224B resistor is intended for use in the TL Radio System.

225A RESISTOR

This resistor has a bifilar winding on a phenolic core and is suitable for use at high frequencies. It is covered by Mylar-backed thermosetting pressure sensitive tape. The resistor is equipped with 0.026 inch diameter tinned axial leads which extend approximately 1-7/16 inches from each end of the body. The resistor may be supported by these leads. The body dimensions are 1/2 inch long by 11/64 inch diameter.

The resistor is wound with nickel-iron wire (Ni 46%, Balance Iron). The temperature coefficient of resistance is specified as a requirement on the completed resistor and in ppm/°C is maximum 3400, minimum 2900.

The resistor is used in the J68404B I.F.Limiter-Amplifier of the TH Radio System to compensate for changes in ambient temperature. The normal operating current in this application is 80 milliamperes. For satisfactory performance in this respect rather than heat dissipating capability, the power rating should be limited to 0.06 watt.

CODE NO.	NOMINAL RESISTANCE AT 25° C $\pm 2\%$ OHMS	TOLERANCE %
225A	8.8	± 4 ohms

DESCRIPTION

These resistors are like the 107-type resistor except that the code numbers apply to a specific value of resistance whereas the 107-type covers a range of resistance values. The 126-type differs from the 107- and 131-types in being enclosed in a metal shell instead of a phenol plastic shell. The 131-type resistors are adjusted to tolerances for inductance as well as resistance, as shown in the table below. The 131-type resistors have inductive and non-inductive (bifilar) winding sections connected in series.

These resistors are equipped with tinned axial terminal leads which extend 2 inches from each end of the resistor. The body dimensions are 1-1/2 inches long by 1/2 inch in diameter. They should not be supported by the lead wires. The power rating is 0.25 watt for continuous operation at 77° F ambient.

Line No.	CODE NO.	RESISTANCE OHMS	TOLERANCE %	INDUCTANCE MICRO-HEN.	TOLERANCE %
1	126A	15	±2	(Non-Inductive)	
2	126C	135	±1	(Bifilar)	
3	131A	12	±2	25	±8
4	131B	20	±2	55	±8

DESCRIPTION

The 130A resistor consists of a resistance winding on a ceramic tube equipped with two radial tinned lead wires, which extend 2 inches from the longitudinal center line of the resistor core tube. The resistive element consists of several turns of resistance tape wrapped around the core tube, covered and secured in place by electrical tape and a bakelite varnish finish.

The body dimensions are 1 inch long by 9/32 inch diameter.

This resistor is used in the 340A plug.

CODE NO.	NOMINAL RESISTANCE OHMS	TOLERANCE %	WATTAGE RATING
130A	72	0.1	0.5

DESCRIPTION

All of these resistors use the 106-type resistor structure, except that the 215-type is provided with No. 47 cord tips at the ends of the two terminal leads. They differ from the 106-type, which covers a range of resistance values, by having a specific value of resistance for each code number.

These resistors differ among themselves in types of windings as follows:

202-type	Mandrellated wire winding
210-type	Inductive winding
211-type	Inductive, copper and resistance wire windings in series
215-type	Bifilar type winding

The body dimensions are 1 inch long by $21/64$ inch diameter. The resistors have 0.026 inch diameter tinned axial lead wires which extend 2 inches from each end, except the 215A which has one lead extending $2-3/16$ inches and the other $1-9/16$ inches from the body of the resistor.

The 210A resistor, in addition to resistance requirement, has an inductance requirement of maximum 0.20 microhenry, minimum 0.10 microhenry.

ELECTRON TUBE BASE - 88-TYPE RESISTORS

DESCRIPTION

These resistors are mounted on electron tube type bases having six terminal pins. The terminal pins of the 88A are strapped so as to provide zero attenuation when in circuit. The other 88-type resistors have a spool containing six windings mounted on the base. The windings form an "H" section and provide attenuation as shown. They are provided with handles to facilitate plugging into a No. 144B electron tube socket

$$Z_1 = Z_2 = 600 \text{ Ohms}$$

Circuit provides strap from 5 to 6

Prong Numbers not marked

$$A = B = D = E$$

$$C = F$$

Clockwise, large prongs are 3 & 4 respectively.

ELECTRON TUBE BASE - 89-TYPE RESISTORS

DESCRIPTION

The 89-type resistors consist of wire wound resistor units potted with microcrystalline wax in electron tube type bases having six terminal pins. They are connected in circuit by inserting in a No. 144-type electron tube socket.

These resistors are used as interchangeable components of pads and equalizers, and the attenuations listed in the following tables are the attenuations introduced by network, or the overall circuit when the 89-type resistors are in circuit.

The resistors are for use in Type A Carrier and Type A2 Video Systems.

FIG. A

FIG. B

Numbers are for reference only and do not in all cases agree with associated socket terminal designations.

DESCRIPTION

98-type resistors are form wound with copper-nickel resistance wire, such as Advance, having a temperature coefficient of resistance of maximum ± 50 PPM/ $^{\circ}$ C. They are assembled in a phenolic case mounted on an electron tube type base having four terminal pins. The resistors are connected in circuit by inserting them in bayonet type electron tube sockets such as the No. 100R Socket.

The resistors are used in toll systems. They are used in place of electron tubes while adjusting filament circuits which are connected to voltage regulated filament batteries.

The windings are connected to the two filament terminals of the base. There are no connections to the grid and plate terminals.

The power rating of the 98-type resistor is 7.0 watts.

Line No.	CODE NO.	RESISTANCE OHMS	TOLERANCE %	SUBSTITUTES FOR ELECTRON TUBE
1	98A	4.5	1	101 & 104 (1 amp)

3	98C	4.0	1	102F
4	98D	2.1	5	102 (1 amp)
5	98F	16.9	0.5	101L

DESCRIPTION

The 113- and 114-type resistors consist of 84-type vitreous enameled resistors enclosed in phenolic cases assembled on electron tube type bases. The 113A resistor base has 6 terminal pins and the resistor is connected in circuit by inserting it in a No. 144B electron tube socket. The 114A and 114B resistor bases have 5 terminal pins and the resistors are connected in circuit by inserting them in No. 141A electron tube sockets.

The resistors are used in J and K Carrier Telephone Systems to adjust heater currents to proper values. For this purpose, the 113A, 114A, and 114B resistors are used as substitutes for the 310A, 311A, and 338A electron tubes, respectively.

The resistor units of the 113A, 114A, and 114B are the 84D, E, and F resistors, respectively. These resistor units are wound with copper-nickel resistance wire, such as Advance, having a maximum temperature coefficient of resistance of ± 50 PPM/ $^{\circ}$ C.

CODE NO.	TERMINALS*	RESISTANCE-OHMS	TOLERANCE %
113A	1 - 6	31.2	1
114A	1 - 5	15.6	1
114B	1 - 5	20.0	1

* There are no connections to the other terminals of the base.

DESCRIPTION

The 116A resistor is a tapped resistor enclosed in a ceramic shell provided with a removable metal cover. It is arranged to mount in a No. 143B electron tube socket, or similar type, with resistance across the filament contacts and has no connection to plate and grid contacts.

The total resistance is 23.5 ohms and by strapping the terminals, resistance may be varied in 0.5 ohms steps from 0 to 23.5 ohms. Resistance values are held within limits of $\pm 5\%$. It is capable of dissipating 4.2 watts continuously.

The 116A resistor is intended for use in the Type "J" Carrier Telephone System in heater circuits.

	0.5	6 - 7

DESCRIPTION

The 125A resistor consists of three vitreous enameled type resistors enclosed in a metal shell and mounted on an octal electron tube base. It is put into circuit by mounting in a KS-13364, L2 or similar type electron tube socket. The three resistors R1, R2, and R3 are connected to the terminals in the tube base as shown in the table. They are KS-8512, L3A type resistors with notched terminals. R2 and R3 are wound with copper-nickel wire, such as Advance or equivalent, and R1 is wound with iron free nickel-chromium wire, such as Nichrome V or equivalent.

125A Resistor

CODE NO.	TERMINALS	R NUMBER	RESISTANCE OHMS	TOLERANCE %
125A	1 - 5	R1	4000	±5
	2 - 3	R2	15	±5
	7 - 8	R3	15	±5

DESCRIPTION

The 127A and 132A resistors consist of several DL67000-type wire wound resistors having ceramic cores and black enamel moisture-resistant finish. The 127A resistor also uses a KS-13490 L2 fixed composition resistor. They are assembled in a rectangular metal can provided with an 8 pin electron tube base designated KS-13871 plug and a 343B coaxial plug. While the 127A and 132A resistors use the same size can and have the same plugs on the same side of the can, the relative positions of the two plugs differ.

The 127A resistor is a dummy amplifier load and the 132A resistor is a dummy regulator load, and consume the same power as an amplifier and a regulator, respectively. When the circuit of an amplifier and regulator are not being used for transmission, the dummy loads are used in place of the amplifier and regulator to conserve the latter units while maintaining the proper voltages and currents on the other amplifier and regulator on the repeater panel.

ELECTRON TUBE BASE - 135A RESISTOR

DESCRIPTION

The 135A resistor consists of a vitreous enameled type resistor enclosed in a phenol fiber shell assembled on an electron tube octal base. The resistor is connected to terminal pins 2 and 7. There are no connections to the six other pins.

The power rating is 7.5 watts at 104° F ambient temperature.

The 135A resistor is used to substitute for the No. 375A electron tube while adjusting heater currents to their proper values in the toll systems telephone repeater program transmission voice amplifier circuit.

CODE NO.	RESISTANCE VALUE OHMS	TOLERANCE %
135A	62.4	±1

ELECTRON TUBE BASE - 148-TYPE RESISTORS

DESCRIPTION

The 148A and B resistors each consist of three resistors enclosed in a housing of insulating material, mounted on an electron tube type base equipped with 6 terminal pins. They are connected in circuit by inserting in a six terminal electron tube socket such as the No. 144B electron tube socket. They are used as 75 ohm unbalanced resistance pads in A2 Video Amplifier equipment.

The component resistors are vitreous enameled resistors manufactured in accordance with specification KS-13657 and have notched terminals. They have essentially non-inductive windings of the Ayrton Perry type and are wound with essentially iron free nickel-chromium resistance wire such as Nichrome V.
