

METHOD OF OPERATION
TRUNK CIRCUIT

Tie Line Between Trouble Desk - And Zero Operator - Trouble Desk - Full
Mechanical Power Driven System.

GENERAL DESCRIPTION

1. This tie line circuit is used between the trouble operator's desk and the zero operator's position.

DETAILED DESCRIPTION

OPERATION

2. When the tie line key at the trouble desk is operated ground is connected to the "S" lead causing the operation of a series of relays in the telephone circuit to connect the telephone set across leads "T" and "R". Also the E540 relay operates lighting the lamp at the distant end and causing the lamp at the trouble desk to burn steadily as a busy signal. The #54-D retardation coil is also bridged across this connection to prevent the cord supervisory lamp at the zero operator's position from lighting.

3. When the call is answered, the lamp at the distant end is extinguished and the E540 relay locks under control of a relay in the sleeve lead to prevent a false flashing recall if the talking key is released before the plug of the cord is withdrawn from the jack at the zero operator's position.

4. On an incoming call the E206 relay operates, connecting interrupted battery to the lamp causing it to flash. When the listening key is operated, the E540 relay operates, releasing the E206 relay which disconnects interrupted battery from the lamp and closing a circuit to light the lamp as a busy signal. The E540 relay locks under control of a relay in the sleeve lead to prevent a false flashing recall should the talking key be released before the connection is taken down at the zero operator's position. When the tie line key is released and the connection is taken down at the distant end, the E540 relay releases, extinguishing the lamp and restoring the circuit to normal.
