This Method of Operation written from issue 11- T-501319.

HETHOD OF OPERATION
SEMDER SRLECTOR
For Stuck Senders - To be used with Subscribers Districts, and Operatores Dialing Districts - Panel Machine Switching System.

## DEVBLUFIMET

## 1. PURPDSS OF CIECUIT

This circuit is used to find distriet selectors which are held up by strack senders.
2. WORIKG TMITS

This ciruit is adepted for use in offices where the battery voltage is from 45 to 50 volts.

## OPERATION

3. PRINCIPAI FUNCTIONS
3.1 To locate a district selector associated with a stuck sender.
3.2 To test succeeding districts anter stucik district has been roleased. before circuit is restored to normal.
4. COMNEOTIG EIECUITS
4.1 Any standard Subsuriber's Jender.
4.2 Any standerd Subscriber's or Operator's Dialing Districts.

## DESCEIPTIOT OF OPEEATION

5. Upon receiving notice of a stuck sender from the sender monitor, the trouble man operates a start key associated with the group of senders in which the particulax sender, which is stuck, is located. The operation of this key places ground on a circuit to the (TO-1) and (TO-2) relays which operate from batttery on their windings. The operation of these relays opens leads to the $(T-1),(T-2),(T-5),(T-4)$, and (T-5) relays, insuring their release in case any of them happen to be operated. The operation of the start key elso closes a circuit from ground through the break contact of the (S-1) relay and make contact of the (ST) key to battery thru the winding of the (3T-1) relay, and selector lamp 1 in series with the 240 hm resistance. The (ST-1) relay operates and locks thru its make contact to ground at the normal ( $\mathrm{S}-1$ ) relay ( $\mathrm{A}^{\prime \prime}$ wiring) or continuity
contacts of the (ST-2) relay, normal (S-2) relay to ground. Selector lamp I lights as a signal that the first selector is nov: being used. When the start key is released, ground is closed thra the break contacts of the keys. make contact of the (SI-I) relay, break contact of the selector magnet, winding of the (TD-1) rolay to bettery and the (TO-1) and (TO-2) relays release. The (ND-1) relay operates and connocts ground thru its make contact operating tive selector magnet. The operation of the magnet opeats the circuit thru the winding of the (D-1) relay which releases and removes the ground from the winding of the magnet. The release of the magnet advances the selector to terminal I and again closes the circuit thru the winding of the (ND-1) relay, repeating the operation as before. The circuit continues to fuaction in this way, advancing the selector step by step until a grounded teminal is encountered in the group associated with the particular key depressed.

## 6. TBRTINNI SRTEOTED

When a grounded terminal is found, a circuit is established thru the selector brush, and the contacts of the (TO-1) or (TO-2) relay to battery thru the winding of the (T) relay corresponding to the selector benk in which the grounded terminal is located. The (T) relay operates and comects ground from the (ST) Leys thru the make contacts of the (ST) relay which is operated at that time, to battery thru the winding of an (iid) relay. This holds the (ID) relay opereted, and ground from the make contact of the (ND) relay holds the corresponding selector magnet opereted, preventing the selector from advancing. The (ISD) relays are slow in releasing to allow the (T) relay sufficient time to operate before the selector magnet can release, and edvance the selector to the next position. The oraration of the (T) relay also closes ground thru an A. lamp brush and teminal of arc 6 of the associated selector to battery thru the corresponding (T) lamp. The number of the selector is indicated by the selector lamp, the bank of the selector by the ( E ) lamp, and the terminal by the ( $I$ ) lamp.

## 7. TGAITMAI CIEARED

When the ground has been removed from the terminal, the (T) relay is $r e l$ eased, extinguishing the ( $T$ ) and ( $K$ ) lamps and releasing the (ND) rolay. The release of the (WD) relay removes the grounc from the selector magnet, which releases and advances the selector to the next terminal. Ground from the start keys through the contacts of the (ST) relay and the magnet again operates the (W) relay, and the selector starts hunting until another ground is found or teminal 21 of the selector reached.

## 8. TEANSFER TO SECOMD SBUECTOR

When terminal 21 is rachec a circuit is closed from ground at the nomal start keys, through terminal 21 and the brush of selector bank 1, contacts of the (TU-1) relay, to battery through the winding of the (T-1) relay. The (T-1) relay operates and connects ground

```

through the break contacts of (ST) keys through make contact of the (T-1) ielay (R-1) lamp, brush and terminal 沈l of selcctor bank 6, to battery through the winding of the (S-1) relay, operating the (S-1) $r \in l a y$. The ground through the other makc contact of the ( $T-1$ ) relay and. make contact of the (ST-1) relay and the winding of the (MD-1) relay, holds the (ID-1) relay operated, wich in turn holds the selector magnet operated, preventing the selector from advancing. The (ST-1) relay is held operated to ground at the normal (S-2) relay, the ( $\$-1$ ) relay operated connects ground through its make contact, contacts of , the (ST-1) relay, winding of the (ST-2) relay and the selector lamp 2, to battery operating the (ST-2) relay and lighting the lam. The (STH-2) relay locks through its make contact, break contact of the (ST-3) relay to ground through the contacts of the ( $5-3$ ) relay, roleasing the. (ST-1) relay, releasing the (ST-I) rolay. The (ST--1) rclay releascd, opens the circuit through the (WD-I) relay, which also reloasos and disconnects ground from the selector magnet. The magnet released, advances selecto: 1 to its normal position releasing the (SWI) and (T-I) relays and extinguishing selector lamp \%in Ground from the (ST) keys, through the contacts of the (ST-2) relay and the sclector magnet 2 operates the (ID-2) relay which connects ground to the magnet. The magnot operatcs opening the circuit through tho ( $\mathbb{D}-\mathrm{m}$ ) relay, which releases, opening the circuit through the magnet. The magnet releases, advancing the selector brushos to position 1 , and the hunting is repeated as for selector 1.

## 9. TRANSFER TO THIRD SBUGCTOR

The operation of the circuit for trans frring from selector to
 is found the transfer takes place after the ground has been removed. If it is necessary to test the remaining terminals, before clearing the first ground, operation of the start key will remove the ground from the (iD) relay, and the selector will advance to the next terminal and resume hunting. The SC leads from the senders are grounded momentarily in normal operation of a premature releaso and the stuck sendor selector may step momentarily on such a terminal but unless the ground is permonont, the selector will pause and then resume its hunting until a porm mancnt ground is encountered.

## 10. EESTORTEG TO HOGTAE

Then terminal. 21 of the last selector is reached, the (T-1) relay operates operating the ( $5-1$ ) $\quad(S-2)$ or ( $5-3$ ) relay as in paragraph 8. Uuder this condition the operation of the (S-1), (S-2) or (S-3) releases the (ST-1), (ST-2) or (ST-3) since no holding ground is provided as in paragraph 8. The release of the (ST-1), (ST-2) or (STMS) relay de-energizes the steppine magnet stepping the selector to terminal 22, releasing the $(\mathrm{T}-1)$ and $(\mathrm{S}-\mathrm{J})$ 。 $(5-2)$ or $(S-3)$ relays and extinguishing the lamo restoring the circuit to normel.
