1. GENERAL

1.01 This section lists and illustrates the standard 2-conductor patching and testing cord and plug assemblies required for the patching and testing of equipment in central offices.

1.02 For convenience in ordering patching and testing cord assemblies, combination apparatus codes as shown in the upper left-hand corner of each item have been established. These codes should be used in all cases for ordering the complete assemblies shown.

1.03 When a part of an assembly is desired for replacing purposes and the part is covered by an individual apparatus code shown directly below the combination assembly code number, the part should be ordered by the individual apparatus code.

1.04 There are some assemblies in which the cord itself is not assigned an apparatus code. In such cases, the combination apparatus code must be used in ordering replacements.

1.05 Assemblies, in which the individual cords are not covered by apparatus codes, are assigned codes such as:

CORD, W2BL

All other assemblies are assigned codes such as:

CORD, 2P1A or 2W2A

where the first letter is always preceded by a numeral. In this latter case, the first numeral indicates the number of conductors in the cord and the first letter indicates whether it is a patching or a testing cord; that is, P means a patching cord (a cord equipped with plugs at both ends) and W means a testing cord. The remainder of the code is used to identify a particular assembly in a group.

1.06 Information pertaining to the relation of plugs and jacks and for ordering plugs separately is covered in Section A710.059.

1.07 Unless otherwise specified, cord conductors have a nominal resistance of 0.2 ohm per conductor foot.
