</tbody>
</table>

INSTALLATION:
1. Power supply can be mounted in Webster TLC equipment boxes, mounting shelves or outside, at any desired location. Two 6-32 x 1-3/4 screws are provided for mounting with TLC 902.
2. A grounding type outlet is required for 3 prong plug at the cord providing input power for power supply. If grounding type outlet is not available, use a 3 to 2 prong adaptor and connect grounding terminal on adaptor to ground. Do not break off grounding prong of plug.
3. Connect white wire with spade lug to minus (-) side and red wire with spade lug to plus (+) side of output power load. These two wires should be connected to terminals 13 & 14 on barrier strip of TLC 902.

PRECAUTIONS:
Under no conditions should these power supplies be used without load. In normal operation use either two VF Amplifiers or one VF Amplifier and a dummy load in other socket. For TLC 901 the dummy load should be a 500 ohm 2-watt resistor. For TLC 906 the dummy load should be a 1000 ohm 5-watt resistor.
FUNCTION
Provide regulated power supply for voice frequency (VF) amplifiers and other communication devices requiring constant voltage operating power with minimum ripple content.

INSTALLATION
1. TLC102 is designed to mount in the TLC902 equipment box, TLC904, 905, 916 mounting shelves. It may be mounted in other mountings containing the proper 11 pin receptacle.
2. Wire connections at receptacle:
   (a). 117 VAC source to Pins 1 and 3.
   (b). Negative (−) 24VDC to Pin 8.
   (c). Positive (+) 24 VDC to Pin 9.
   (d). Chassis ground to Pin 11.
   NOTE: Positive (+) side of this power supply is not grounded. If grounded positive (+) is required, connect Pin 9 to Pin 11 on mating receptacle, or to other desired ground.

MAINTENANCE
117 VAC, 1/16 A-250V fuse is contained within power supply housing, to replace:
   (a). Remove power supply from mounting.
   (b). Remove two (2) screws from plug end of power supply.
   (c). Remove cover, replace fuse and reassemble.
No additional maintenance is necessary except to check input and output as may be required.

FUNCTION:
To provide 24 VDC operating power to ten 300 MA loads.

SPECIFICATIONS:

- **Input Voltage**: 105-125 VAC, 50-60 CPS @ 1.1 Amps RMS
- **Input Power (Max.)**: 125 Watts at full load
- **Input Fuse**: 2A, 125V.
- **Input Power Connection**: 7' cord with attached 3 prong plug, also plugs into unit.
- **Output Voltage**: 24 VDC @ 3 Amps total
- **Output Power (Max.)**: 72 Watts total at full load
- **Output Connections**: 1-screw type - .3 Amps each
- **Output Fuses**: One 3 Amp, Main Fuse
  - Ten .3 Amp, Protection at each output
- **Ripple Voltage**: Max 2 MV at full load
- **Regulation**: ± 1 Volt no load to full load
- **Controls**: AC on/off switch, DC Voltage Adjustment, selector switch and meter to check main DC Voltage and DC Voltage at each of 10 outputs.
- **Meter Range**: 0 to 30 Volts DC
- **Voltage Adjustment**: Adjusts main output to 24 volts
- **Transistors**: Four Total (2)-2N3232 Silicon, (1)-2N269 and (1)-2N301 Germanium
- **Diodes**: Four Total (4)-367D 10A 200V.
- **Short Circuit Protection**: Fuse protection of Transistors under all operating conditions.
- **Size**: 19" Rack Mt. x 3-1/2 high x 8" deep
- **Construction**: 16 gauge metal - removable front panel - perforated screen top and bottom for ventilation.
- **Finish**: Telephone grey baked enamel.

INSTALLATION:
1. Power supply designed for standard 19" rack mounting.
2. A grounding type outlet is required for 3 prong plug at the cord providing input power for power supply. If grounding type outlet is not available, use a 3 to 2 prong adaptor and connect grounding terminal on adaptor to ground. Do not break off grounding prong of plug.
FUNCTION:
To provide 300 MA operating power for voice frequency (VF) Amplifiers.

SPECIFICATIONS:
- Input Voltage: 105-125 VAC, 50-60 CPS
- Input Power (Max.): 15 Watts at full load
- Input Fuse: 1/4 A, 125 V, SLO-BLO
- Input Power Connection: 3 Prong plug with 5 ft. cord
- Output Power: 24 VDC @ 300 MA
- Ripple Voltage: 2 MV at full load
- Output Power Connections: Thru 11 point Octal type plug
- Size: 2-11/32 x 3-3/32 x 7-1/4
- Weight:

INSTALLATION:
1. Power supply can be mounted in Webster TLC equipment boxes, mounting shelves or outside, at any desired location.
2. A grounding type outlet is required for 3 prong plug at the cord providing input power for power supply. If grounding type outlet is not available, use a 3 to 2 prong adaptor and connect grounding terminal on adaptor to ground. Do not break off grounding prong of plug.
Incorporating the latest advances in circuit design the following new model numbers have been assigned.

### 200 Series
- TLC213
- TLC214
- TLC215

### 300 Series
- TLC317
- TLC318
- TLC319

### 400 Series

* Special replacement for TLC303 and TLC306 are available on special order only. They have 50,000 ohm output impedance, 150/600 ohm input impedance.

** Special replacements for TLC405 and TLC406 are available on special order only. These amplifiers have SL (split loop) wiring arrangement. They will be shipped as TE versions of TLC407 or TLC408.

*** TLC312 replacement available on special order only. This amplifier has 60 ma drain for V3 repeater application and is equipped with equalization circuit.

<tr>
<td>Gain (Up to Control Threshold)</td>
<td>-12 DB</td>
<td>14 DB</td>
</tr>
<tr>
<td>Control Threshold</td>
<td>-10 DB (-6 DB)</td>
<td>-6 DB</td>
</tr>
</tbody>
</table>

Control Ratio (Min.) 30 to 1: A 30 DB increase in input above the control threshold results in 1 DB increase in output.

Input Impedance: 600 ohms (some models may be reconnected for 150 ohms loop).

Output Impedance: 600 ohms (some models may be reconnected for 150 ohms loop).

Frequency Response: -1 DB at 150 cps and 8000 cps, -3 DB at 80 cps and 15,000 cps, referred to 1000 cps response.

Power Required: Nominal 24 VDC models, 12-26 V at 30-50 ma.

Nominal 48 VDC models, 24-52 V at 30-50 ma.

Total Distortion Harmonic (At full level control): 1% at higher value of nominal dc voltage range. (26 and 52 V).

1.5% at lower value of nominal dc voltage range. (12 and 24 V).

Output Noise Level: 65 DB below output at higher value of nominal DC voltage range. (26 and 52 V). 75 DB below output at lower value of nominal DC voltage range. (12 and 24 V).

Monitor Winding: Test jack output is 11 DB below signal output with outputs loaded with 600 ohms.

Simplex Resistance: 5 ohms input winding, 13 ohms output winding (loop resistance 4 times the above).

Simplex Current: Max. 100 ma (5 ma max. unbalance).

Control Attack Time: 15 msec.

Control Release Time: 1.5 sec.

Dimensions: 1-5/8 x 1-5/8 x 7-5/8 overall.

Weight: 19 ounces.

Color: Zinc plate with dichromate finish.

Plug: 11 pin, amphenol 86CP11.

Monitor Jacks: Accessible from front panel. Also connected to pins 5 and 6 with LM wiring.

INSTALLATION:

1. Make the connections to mounting-socket pins as shown on schematic diagram on reverse side of this page. Observe polarity at supply-voltage pins 8 (-) and 9 (+). If polarity is reversed, amplifier will not operate but will not be damaged.

2. To install amplifier, plug it into assigned 11-pin socket. To remove, use approved extractor tool that fits into flange holes at front of amplifier.

OPERATION:

The line level control amplifier is designed to accept a wide range of input signal amplitudes but to provide an output amplitude which varies only over a narrow range. The amplifier will:

1. Accept a wide range of signal levels.

2. Experience only a small increase in output in response to increases of input beyond some predetermined input level.

3. Have minimum distortion over the full designed range of operation.

4. Respond quickly to increases in input.

5. Present a constant impedance to the output line for signals imposed externally to the output of the amplifier.

6. Present a constant impedance to the output line for signals imposed externally to the output of the amplifier.

7. Offer advantages of compactness and durability associated with transistors and other solid state devices.

Control of the amplifier is by means of a bridge network in the input circuit. A photocell is in one leg of the bridge and the bridge is designed so that it is essentially balanced when the photocell is fully illuminated. A portion of the amplifier output is rectified, amplified, and used to light a lamp which in turn illuminates the photocell. With signals small enough to be below the control level, the feedback voltage is not enough to cause forward conduction by the rectifying diode and no voltage is applied to the lamp. The dark photocell results in an imbalance of the bridge so that nearly all the input signal is applied to the first stage of amplification. Under this condition the amplifier has linear gain characteristics.

At some designed output signal level, the feedback voltage exceeds the knee of the diode causing good conduction by the diode. The resulting voltage is amplified and fed to the lamp, the photocell is illuminated, and the bridge brought very close to balance. Thus, only a small portion of the input signal is applied to the first amplifier stage.

This method of control does not affect the operating point of the 2-stage amplifier which acts as a low distortion, stabilized-gain amplifier with further characteristics outlined above. Typical values for the specific points are:

1. Signal levels from noise level up to + 30 DBM may be applied to the input.

2. The output will be to a value of approximately + 2 DBM or + 8 DBM linearly for an input of about -10 DBM or -6 DBM and then will rise only 1-2 DBM more up to maximum input.

3. Maximum distortion is 1.5% with maximum compression.

4. Attack time is 10-15 milliseconds.

5. Input impedance is 600 ohms ± 10%.

6. Output impedance affecting reflections is 600 ohms ± 10%.

OPERATING INSTRUCTIONS:

1. Apply DC voltage as shown on schematic. Power source should have maximum ripple of 1 millivolt at 24 V or 2 MV at 48 V in order to attain minimum noise.

2. Connect external capacitors across split transformer winding if shown on schematic.

3. If plugged in horizontally, some extra support should be supplied in addition to socket.

4. When the output and the test jack terminals are loaded with 600 ohms the output signal here will be 11 DB below the main output of the amplifier.

MAINTENANCE:

No routine maintenance is necessary except to check gain and output as may be required. Normal operating voltages are shown on the schematic. If it becomes necessary to replace the 2N1183 control transistor, the accompanying feedback resistor may need reselection to keep the output impedance within desired limits. Its value may vary between 39 K and 130 K in a particular amplifier.

TELEPHONE PRODUCTS DIVISION
WEBSTER ELECTRIC
RACINE, WIS.
SPECIFICATIONS:

Gain Stability: No appreciable variation in gain as voltage varies from low to high values.
Power Capability: + 20 DBM with normal distortion. + 10 DBM with minimum distortion.
Frequency Response (referred to 1000 cps response): -1 DB at 200 cps and 8 KC. -3 DB at 100 cps and 15 KC.
Power Required: Nominal 24 VDC models, 20-26 V at 25-30 ma.
Nominal 48 VDC models, 40-52 V at 25-30 ma.
Output Noise Level: 65DB below output at higher value of nominal dc voltage range. (48 V), 75 DB below output at lower value of nominal dc voltage range. (24 V).
Total Distortion Harmonic (at + 9 DBM output): 1.0% at higher value of nominal dc voltage range. (48 V), 1.0% at lower value of nominal dc voltage range. (24 V).
Input Impedance: 600/900/1200 ohms (may be reconnected for 150 ohms loop).
Output Impedance: 600/900/1200 ohms (may be reconnected for 150 ohms loop).
Monitor Winding: Test jack output is 11 DB below signal output with outputs loaded with 600 ohms.
Simplex Resistance: 5 ohms input winding, 8 ohms output winding (loop resistances 4 times the above).
Simplex Current: Max. 100 ma (5 ma max. unbalance).
Operating Voltage: TLC315 - 24 V.
TLC316 - 48 V.
Surge Protection: This series of V.F. amplifiers maybe ordered equipped with surge protection on input and output by adding the suffix "X" to the model number - example - TLC316/X.
Dimensions: 1-5/8 x 1-5/8 x 5-5/8 overall.
Weight: 16 ounces.
Color: Zinc plate with dichromate finish.
Plug: 11 pin, amphenol 86CP11.
Monitor Jocks: Accessible from front panel. Also connected to pins 5 and 6 with LM wiring.

INSTALLATIONS:

1. Make the connections to mounting-socket pins as shown on schematic diagram on reverse side of this page. Observe polarity at supply-voltage pins 8 (-) and 9 (+). If polarity is reversed, amplifier will not operate but will not be damaged.
2. To install amplifier, plug it into assigned 11-pin socket. To remove, use approved extractor tool that fits into flange holes at front of amplifier.

OPERATION:

The V.F. Repeater amplifier is designed to provide a linear amplification of various input levels depending on the gain control setting. The amplifier will:
1. Provide a maximum output of 10 MW or +10 DBM at the minimum distortion.
2. Provide 39 DB gain without equalization thus giving normal output with an input signal of 25 millivolts.
3. Accept larger input signals without causing distortion if the gain control is turned lower.
4. Have a maximum of 1.0% distortion at +9 DBM.
5. Will have input and output impedances of 600, 900, 1200 ohms ± 10%.
6. Offer advantage of compactness and durability associated with transistors and other solid state devices.

OPERATING INSTRUCTIONS:

1. Apply DC voltage as shown on schematic. Power source should have maximum ripple of 1 millivolt on 24 V models and 2 MV on 48 V models in order to attain minimum noise.
2. Connect external capacitors across split transformer winding as shown on schematic on the SL wiring models.
3. If plugged in horizontally, some extra support should be supplied in addition to socket.
4. When the output and the test jack terminals are loaded with 600 ohms, the output signal here will be 11 DB below the main output of the amplifier.
5. Different input and output impedances are obtained internally by moving impedance pin to desired jack 6 (600), 9 (9000), 12 (1200).

MAINTENANCE:
No routine maintenance is necessary except to check gain and output as may be required. Normal operating voltages are shown on the schematic.

Litho
in U.S.A.
GENERAL
The V.F. Repeater amplifier is designed to provide a linear amplification of various input levels depending on the gain control setting. The amplifier will:

1. Provide a maximum output of 10 MW or +10 DBM at the minimum distortion.
2. Provide 40 DB gain without equalization thus giving normal output with an input signal of 25 millivolts.
3. Accept larger input signals without causing distortion if the gain control is turned lower.
4. Provide equalization (if furnished) for a line having a total loss difference of 12.5 DB between 300 cps and 3300 cps signals.
5. Provide equalization that is adjustable by means of a variable resistor. Total line loss plus equalized amplifier gain is constant for various frequencies within a total of 2 DB spread.
6. Have a maximum of 0.5% distortion at +10 DBM output.
7. Will have input and output impedances of 600 ohms ± 10%; 900 ohm ± 10% and 1200 ohm ± 10%.
8. Offer advantage of compactness and durability associated with transistors and other solid state devices.

The amplifier comprises 2 stages having low distortion, good frequency responses, and stable characteristics. On equalized models a variable resistor following the gain control provides a loss circuit which is paralleled by a capacitor. This combination produces a greater series loss at low frequencies than at high and its loss curve is the inverse of a nonloaded cable line. The combined loss of the cable and the equalizer is approximately constant for all frequencies from 300 to 3300 cps.

SPECIFICATIONS:
- Gain: 40 db (adjustable 0-40)
- Gain stability: less than 0.5 DB variation in gain when operating voltage is 24 ± 4 VDC or 48 ± 8 VDC.
- Temperature stability: no more than 0.5 DB gain variation from 0°C. to +60°C. free air ambient.
- Rated power output: ± 10 DBM with less than 1% THD., +18 DBM with less than 5% THD.
- Frequency response: (referred to 1,000 cps): -6 DB 100 cps to 8 KC. -3 DB 100 cps to 15 KC.
- Power required: 20-28 VDC or 40-56 VDC ± 18 ma.
- Output noise level: ±70 DBM.
- Total harmonic distortion (at + 10 DBM output): 0.5%.
- Input impedance: 600/900/1200 ohms ± 10%. 150 ohm impedance may be obtained when simplex is not required.
- Output impedance: 600/900/1200 ohms ± 10%. 150 ohm impedance may be obtained when simplex is not required.
- Monitor winding: test jack output is 11 DB below signal output when output is terminated in matched load.
- Simplex winding: 5 ohms input winding, 8 ohms output winding. (Loop resistance 20 ohms input, 32 ohms output).
- Simplex current: max. 100 ma (5 ma maximum unbalance.)
- Equalization: Those models so equipped provide equalization for a non-loaded line having a total loss differential of 12.5 DB between 300 cps and 3300 cps signals. This equalization is adjustable between zero and maximum so that total line loss plus equalized amplifier gain is constant for various frequencies within a total of 2 DB spread.
- Surge protection: this series of V.F. amplifiers may be ordered equipped with surge protection on input and output by adding the suffix "X" to the model number - example - TLC317 "X".
- Dimensions: 1-5/8 x 1-5/8 x 5-5/8 overall.
- Weight: 16 ounces.
- Color: zinc plate with dichromate finish.
- Plug: 11 pin, amphenol 86CP11.
- Monitor jacks: accessible from front panel. Also connected to pins 5 and 6 when LM wiring models are specified.

OPERATING INSTRUCTIONS:
1. Select input and output impedance by moving jumper to proper pin on circuit board. Impedances are marked on circuit board as 6 - 9 - 12. (for 600, 900 and 1200 ohms). Factory strapped for 600 ohms.
2. Apply DC voltage as shown on schematic. Power source should have maximum ripple of 1 millivolt on 24 V models and 2 MV on 48 V models in order to attain minimum noise.
3. Connect external capacitors across split transformer winding as shown on schematic on the SL wiring models.
4. If plugged in horizontally, some extra support should be supplied in addition to socket.
5. When the output and the test jack terminals are loaded with 600 ohms, the output signal at the monitor jacks will be 11 DB below the main output of the amplifier.
6. For a 100% line the equalizer loss will vary from 2-3 DB at 3300 cps to 12.5-13.5 DB at 300 cps. The equal control should be set to provide this 300 cps loss and the 3300 cps value checked. The difference between the low and high frequency losses should be 10.5 DB. For other length lines the 3300 cps loss should be the same % of 10.5 DB. The maximum length is a 120% line. After the equal control is set, the locking nut should be tightened to preserve this setting.
INSTALLATION:
1. Make the connections to mounting-socket pins as shown in schematic diagram on this page. Observe polarity at supply-voltage pins 8 (-) and 9 (+). If polarity is reversed, amplifier will not operate but will not be damaged.
2. Tighten voltage selection screw in bottom for 24 V operation. Remove for 48 V operation.
   Note: The voltage screw is factory adjusted for 48 Volt operation.
3. To install amplifier, plug it into assigned 11-pin socket. To remove, use approved extractor tool that fits into flange holes at front of amplifier.

MAINTENANCE:
No routine maintenance is necessary except to check gain and output as may be required. Normal operating voltages are shown on the schematic.

FUNCTION:
The TLC500 Series of microphone pre-amplifiers are designed for special applications where it is desirable to use low impedance microphones to drive a 600 ohm telephone line or high power amplifier.

The TLC501, TLC503 and TLC505 are designed for driving telephone lines. The TLC502 and TLC504 are for driving power amplifiers having a 50,000 ohm or higher input impedance.

This series of three (3) stage transistor amplifier functions as combined pre-amplifier and line amplifier.

SPECIFICATIONS:

- **Gain:** 60 db (adjustable 0-60)
- **Gain Stability:** No appreciable variation in gain as voltage varies from low to high values.
- **Frequency Response:**
  - (0 - 1000 cps) 200 - 3300 cps ± 1.0 db.
  - 100 - 8000 cps ± 3.0 db.
- **D.C. Power Required:** TLC501, TLC502 and TLC505: 24 VDC nominal @ 30 MA (15 MA at 12 VDC minimum). TLC503 and TLC504: 48 VDC nominal @ 30 MA (15 MA at 24 VDC).
- **Output Noise Level:** TLC501, TLC502 and TLC505: -50 dbm @ 24 VDC. TLC503 and TLC504: -50 dbm @ 48 VDC.
- **Total Harmonic Distortion:** (at 0 dbm output with nominal operating D.C. voltage) 200 - 3300 cps = 1%.
- **Input Impedance:** 50, 150 or 250 ohms. Balanced, selectable on mounting socket.
- **Output Impedance:** TLC501, TLC503 and TLC505: 600 ohms ± 10% TLC502 and TLC504: 50,000 ohms.
- **Simplex Resistance:** (Output Winding Only) TLC501 and TLC503 - 50 ohms loop resistance 200 ohms.
- **Simplex Current:** Max. 100 MA (5 MA max. unbalance)
- **Dimensions:** 1-5/8" x 1-5/8" x 5-5/8" overall.
- **Weight:** 16 ounces.
- **Color:** Zinc plate with dichromate finish.
- **Plug:** 11 pin amphenol 86 CP11.
- **Monitor Jacks:** Accessible from front panel (Jacks bridge output).

INSTALLATION:
1. Make the connections to mounting-socket pins as shown on schematic diagram on reverse side of this page. Observe polarity at supply-voltage pins 8 (-) and 9 (+). If polarity is reversed, amplifier will not operate but will not be damaged.
2. To install amplifier, plug it into assigned 11-pin socket. To remove, use approved extractor tool that fits into flange holes at front of amplifier.

OPERATING INSTRUCTIONS:
1. Connect two (2) conductor shielded LO Z microphone cable to:
   - Pin 1 and 10 for 50 ohm microphones
   - Pin 1 and 5 for 150 ohm microphones
   - Pin 1 and 2 for 250 ohm microphones
   - Shield to ground (Pin 11)
2. Apply DC voltage as shown on schematic. Power source should have maximum ripple of 1 millivolt on 24 V models and 2 MV on 48 V models to attain minimum noise levels.
3. Connect external capacitors across split windings on models having SL connection as shown on schematic.
4. If plugged in horizontally, some extra support other than socket should be supplied.

MAINTENANCE:
No routine maintenance is necessary except to check gain and output as may be required. Normal operating voltages are shown on the schematic for internal test points.

CHASSIS SN/D
FUNCTION:
These bridging amplifiers are designed to drive monitoring headsets from hot line networks with negligible insertion loss.

The amplifier comprises three stages having low distortion, good frequency responses and, stable characteristics. On equalized models, a variable resistor following the first stage provides a loss circuit which is paralleled by a capacitor. This combination produces a greater series loss at low frequencies than at high frequencies, and its loss curve is the inverse of a non-loaded cable line. The combined loss of the cable and the equalizer is approximately constant for all frequencies from 300 to 3300 CPS.

THE AMPLIFIERS WILL:
1. Provide a maximum output of 10 MW or +10 DBM at minimum distortion.
2. Provide 50 DB gain without equalization thus giving normal output with an input signal of 25 MV.
3. Accept larger input signals without causing distortion if gain control is turned lower.
4. Provide equalization that is adjustable by means of a variable resistor. Total line loss plus equalizer amplifier gain is constant for various frequencies within a total of 2 DB spread.
5. Have a minimum of 1.5% distortion at +10 DBM output.
6. Will have input impedance of 120 K ohms and output impedance of 150 ohms ± 10%.
7. Offer the advantage of compactness and durability of solid state circuitry.

INSTALLATION:
1. Make the connections to mounting socket pins as shown in schematic diagram on reverse side. Observe polarity at supply voltage pin 8 (-) and 9 (+). If polarity is reversed, amplifier will not operate, but will not be damaged.
2. To install amplifier, plug into its assigned 11 pin socket. To remove use approved extractor tool (TLC914).
3. If plugged in horizontally, some extra support, other than the socket should be supplied.
4. Connect external capacitors across split transformer winding as shown on schematic for the SL wiring models.

EQUALIZER OPERATION:
For a 100% line, the equalizer loss will vary from 2-3 DB at 3300 CPS to 10.5 DB at 300 CPS. The equal control should be set to provide this 300 CPS loss and the 3300 CPS value checked. The difference between the low and high frequency losses should be 10.5 DB. For other length lines, the 3300 CPS loss should be the same % of 10.5 DB. The maximum length is a 120% line. After the equal control is set, the locking nut should be tightened to preserve this setting.

MAINTENANCE:
No routine maintenance is necessary except to check gain and output as required. Normal operating voltages are shown on the schematic.

SPECIFICATIONS:
- Input Impedance: 120 K ohms.
- Output Impedance: 150 ohms.
- Output Noise Level: 60 DB below output at higher value of nominal voltage range (26 and 52 V) 1%
- Frequency Response: Referred to 1000 CPS response.
- Gain: 50 DB (Adjustable 0-50)
- Gain Stability: No appreciable variation in gain as voltage varies from low to high values.
- Total Harmonic Distortion: 0.5% at higher value of nominal dc voltage range (26 and 52 V). 1% at lower value of nominal dc voltage range (12 and 24 V).
- Power Capability: +20 DBM with normal distortion, +10 DBM with minimum distortion.
- Simplex Resistance: 400 ohms.
- Simplex Current: Maximum 100 ma - 5 ma maximum. Inbalance when using simplex connection.
- Power required: Nominal 48 VDC models, 12-26 V at 15-30 ma.
- Equalization: Models so equipped provide equalization for a non-loaded line having a total loss differential of 10.5 DB between 300 CPS and 3300 CPS signals. Equalization is adjustable from 0 to maximum so that total line loss plus equalizer amplifier gain is constant for various frequencies within a total of 2 DB spread.

Controls: Gain and Equal. Gain remote on TLC601.
Monitor Jacks: Located on front panel.
Monitor Windings: Test jack output bridges output windings.
Dimensions: 1-5/8" x 1-5/8" x 5-5/8" overall.
Weight: 16 ounces.
Color: Zinc plate with dichromate finish.
Plug: 11 pin. (Amphenol 86CP11).
TLC701 Terminating Set

The TLC701 terminating set is a plug-in unit designed for use in Webster Electric 2-4 wire terminating systems.

The TLC701 terminating set is completely wired. It contains the hybrid coils, signal bypass capacitors, two (2) selectable compromise networks (600 or 900 ohm in series with 2.0 mfd.) and simplex inductor. The front panel mounted S2 switch permits selection of the proper hybrid coil impedance ratio for operation from 600 or 900 ohm drops to assure a maximum return loss factor. The selection of the 600 or 900 ohm compromise networks, simplex inductors and strapping of the B & D leads are by means of front panel mounted screw type switches.

Internally two (2) 1.0 mfd. capacitors are available for the signal bypass circuit. Normally one of the capacitors is factory wired. When the cover of the TLC701 is removed a simple strapping arrangement allows the second 1.0 mfd. capacitor to be paralleled with the factory wired capacitor to provide 2.0 mfd. when required in the signal bypass circuit. Additionally two (2) 1.0 mfd. capacitors are provided in the hybrid balance network to offset the capacitance in the signal bypass circuit, and maybe strapped into the circuit as required.

The A, B, D, F and G leads are extended to the 20 pin connector of the TLC701 term set. Leads for connection to external balancing networks are also extended to the unit connector and are wired through the mating connector of Webster Electric term set mounting shelves to an appropriate socket for use with Webster Electric plug-in balancing networks.

The internal compromise networks may be used in conjunction with the TLC851 NBOC unit when build out capacitance is required.

TLC701 specifications:

**IMPEDEANCE:**

2 Wire Impedance: 600 or 900 ohm selectable by operation of front panel mounted S2 switch.
4 Wire Impedance: 600 or 900 ohm when required.

Internal Compromise Net: 2.0 mfd in series with either 600 or 900 ohm resistors selectable by operation of S3 switch (900 ohm) or S4 switch (600 ohm).

Hybrid Insertion Loss: Transmit circuit 4db approx. Receive circuit 4db approx. 200-6000 cps.

**TRANS-HYBRID LOSS**

(with 600 ohms in series with 2.0 mfd 2 wire termination)

RETURN LOSS (Continued)

**Maximum out of Balance Current in Signal Winding:** - 100 ma.

**Dimensions:** - 3-3/8" wide x 1-5/8" high x 6-31/32" deep, excluding plug.

**Weight:** - 1 lb. Approximately

**Color:** - Zinc plate with Dichromate finish.

**Plug:** - 20 pin Cinch Jones 213-20-00-116 to mate with 211-20-01-031

**FRONT PANEL CONTROLS** - 6 (1 rotary, 4 screw type switches)

**Switch Function:** 
- **S1** - Strapps D and B leads - normally operated.
- **S2** - Selects hybrid coil ratio; Position 1 provides 900 ohm drop impedance and 600 ohm 4 wire impedance when 900 ohm COMP NET switch (S3) is operated. Position 2 provides 600 ohm drop impedance and 600 ohm 4 wire impedance when 600 ohm COMP NET switch (S4) is operated.

When 900 ohm drop and 900 ohm 4 wire impedances are required select position 2 and operate 900 ohm COMP NET switch (S3).

- **S3** - Selects 900 ohm compromise network.
- **S4** - Selects 600 ohm compromise network.

S5 and S6 are simplex inductor shorting switches; when operated simplex inductors are shorted.

**NOTE:** The 6th screw type switch is not wired and is for special service wiring when required.
The TLC731 4-wire terminating unit is designed to allow quick, dependable and uncomplicated conversion of 4-wire VF telephone circuits to 2-wire facilities. Particularly suited for VF extension of 4-wire carrier derived facilities and PBX tie line service, the TLC731 unit provides versatility and simplicity required to meet modern transmission objectives. Designed to accept a wide array of "plug-in" components the TLC731 unit allows use of variable balancing networks, filters, attenuators, equalizers and VF amplifiers. A jack field, containing 13 jacks, allows ready access to all points in the circuit for routine testing and circuit alignment.

Designed for mounting in a 19" rack, the TLC731 unit requires 1-3/4" of panel space and measures 8-1/2" front to back, fully complemented.

The completely wired TLC731 shelf assembly provides E & M signalling extension through the jack field for testing and extends the A, B, D, F, G and simplex leads of the plug-in TLC701 term set to the screw type terminal board on the rear of the shelf.

The TLC731 shelf assembly includes no plug-in units except for two (2) dummy wired plugs for insertion in sockets where no plug-in unit is required.

The following block diagram shows the socket line up of the TLC731 shelf and typical plug-in units used.

A typical fully complimented system would be as follows:
1. TLC731 Shelf equipped with
   1 TLC701 Term Set
   2 TLC811 Pad adaptors - appropriate WE Co. 89 type resistors
   2 TLC300 Series Amplifiers
     (TLC301 for 24V system, TLC304 for 48V system)
   1 TLC851 NBOC

The TLC811 pad adaptors are equal to the W. E. Co. IC pad adaptor and will accept W. E. Co. 89 type resistors. The TLC811 pad adaptor may be replaced with a TLC813 variable (0-25 db in 5 db steps) attenuator, the TE1284 attenuator (0-40 db in 1 db steps), the TLC801 adjustable equalizer, or the TLC866 filter (0-2850 cps).

The TLC300 series V. F. amplifiers are normally plugged into sockets 4 and 5, and signalling is derived from the C. T. of the amplifiers. However, the amplifiers can be plugged into sockets 3 and 6 if desired. Attenuator, filters etc., may be used in socket 4 and 5 and signalling bypassed. (See signalling section).

The TLC851 NBOC (net build out capacitors) may be replaced with precision or compromise balance networks to meet various cable or open wire facilities (See network section).

The TLC701 term set is a plug in unit which contains the HYBRID coils and signal bypass capacitors, basic compromise network which consists of a 2.0 mfd capacitor in series with a 600 or 900 ohm precision resistor which are selectable by operation of the S3 or S4 switch, to allow a 600 or 900 ohm balance to be obtained against the 2-wire drop circuit. The 600 or 900 ohm impedance of the HYBRID COILS is selected by operation of the S2 switch. Simplex inductors are an integral part of the TLC701 and inductor shorting switches are accessible on the front panel.
1. System includes TLC731 rack mount, TLC701 2-4 term set, balancing networks, pads and amplifiers as required.

3. Capacitors shown in red.

NOTES

2-4 WIRE TERMINATING SYSTEM
(WIRING DIAGRAM)
SIGNALLING SECTION

In the design of the TLC731 4-wire terminating unit and the TLC701 term set, Webster Electric Company provides simplicity and versatility in deriving signal circuits.

E and M signalling circuits are easily obtained to meet most requirements. Bypass signal circuits are easily obtained by simple strapping on the screw type terminal strip mounted on the rear of the TLC731 unit. This silk screened terminal strip features ready identification of all signal circuit leads.

The A, B, D, F and G leads of the TLC701 term set are extended to the terminal board of the TLC731 and are clearly marked as are the A1, B1 leads from the "MOD IN", and the A2, B2 leads from the "DE-MOD OUT" circuits. Two (2) jacks in the jack field of the TLC731 unit are labeled "E & M". One jack is identified as "LINE" and the other as "EQUIPMENT". The purpose of the two (2) jacks is to provide routine test points for the "E & M" signalling system.

The jack identified as "LINE" extends the "E" and "M" leads to the terminal board and are available for strapping to the appropriate "A1" or "A2" leads of the 4-wire circuit. The jack, when operated by insertion of a standard 1/4" three circuit (T, R and S) plug, opens the signal leads from the signal set and isolates the signal leads on the 4-wire side for testing.

The jack identified as "EQUIP" breaks the circuit of the 4-wire side and allows testing through the signalling set, and the "A & B" leads to the 2-wire drop side of the circuit. The leads from the "EQUIP" jack are extended to the terminal board and are identified as "E1" and "M1".

The F, G and D (S1) leads are for use in PBX tie line or trunk facilities in accordance with Western Electric practices.

The drawing below shows wiring details of the signalling circuit arrangement of the TLC731 and TLC701 units. The dashed (---) lines show installer furnished wiring.

Note that two (2) 1.0 mfd capacitors are shown in the split winding of the hybrid coils where the A, B and D leads are derived, also that the balance windings have two (2) 1.0 mfd capacitors. By strapping E1 to E2, and E3 to E4, internally in the TLC701 term set, 2.0 mfd may be introduced in the signalling circuit. It is necessary, if 2.0 mfd blocking is used in the signal circuit, that 2.0 mfd be used in the balance circuit. Strapping of E1 to E2, and E3 to E4 assures proper balance. IF THE BALANCE CIRCUIT CAPACITANCE IS NOT EQUAL TO THE SIGNAL CAPACITANCE, POOR TERMINAL BALANCE WILL RESULT.

J4 and J5 are the sockets that mount the plug-in amplifiers or transformers which terminate the 4-wire circuit. If amplifiers or transformers having C. T. windings are used, the C. T. becomes the A1 and A2 leads and may be used to derive signalling. If split loop amplifiers or transformers are used in J4 and J5, A1 must be strapped to B1, A2 to B2, or capacitors may be used for D. C. blocking in special signal arrangements. If capacitors are used in the A1 - B1, and A2 - B2 circuit, care must be exercised to assure balancing in TLC701 circuit. Two (2) terminals labeled XB are supplied on the TLC731 rear terminal strip, and may be used to add capacitance if required to balance the signal capacitance.

If separate signalling facilities are derived from carrier terminals, the E & M leads from such systems may be extended directly to the "E & M" terminals of the TLC731 (if test facility is desired), or directly to the signalling set, then to the "A & B" leads for drop signalling.

The TLC701 term set includes simplex inductors which may be used if desired. Simplex inductor shorting switches are mounted on the front panel and short the inductors when activated (full clockwise).

The input leads SX and SX1, and output leads A3 and B3 are extended to the terminal strip of the TLC731 unit for easy access.

The simplex inductors may be strapped into the circuit as required. If not used, simply bypass wiring around the inductors and disregard them as circuit elements.
Description

The TLC732 4-wire repeater terminating unit is designed to allow quick, dependable and uncomplicated conversion of 4-wire V.F. telephone circuits to 2-wire facilities.

Mounted in its own equipment box this fully wired unit is suitable for wall mounting on customer location, or wherever a simple 2-4 wire, self-contained, terminating repeater is required.

The basic unit is completely wired and is equipped with the hybrid coils, a strappable compromise balancing network, (600 or 900 ohms in series with 2.0 mfd.) sockets for plugging in the optional V.F. amplifiers, idle termination relay, and mounting facilities for the power supply. Two (2) dummy plugs are furnished for insertion in the amplifier sockets when V.F. amplifiers are not required.

Signal bypass circuits may be derived at the line side of the 4-wire circuit when V.F. amplifiers are used by means of the center taps on the amplifiers. The A & B leads of the hybrid coils are extended to the screw type terminal strip.

The 2-wire drop impedance is established at the factory as 900 ohms, but may be converted to 600 ohms by simple strapping in the field.

The 4-wire circuit impedances of the hybrid are 600 ohm as shipped to match the TLC300 series amplifier impedances. Simple strapping in the field permits 900 ohm operation of the 4-wire branches of the hybrid when required.

The above mentioned strapping is accomplished on a strapping board which is part of the basic unit.

All connections to the TLC732 terminating unit are made to a screw type terminal strip.

A typical fully complimented system would be as follows:
1. TLC732 Terminating Unit
2. TLC300 Series Amplifiers (TLC317 - TLC322)
3. TLC100 Series Power Supply (TLC101 for 24v operation, TLC106 for 48v operation)
4. TLC881 Idle Circuit Termination Relay

Technical Information

The TLC732 is a self-contained 2-wire to 4-wire terminating unit. The chassis serves as a base for wall mounting the unit. The cover completely encloses the unit for unobtrusive installation.

The chassis is completely wired and contains the assembled hybrid coils, compromise networks, signal bypass, strapping field, sockets for the V.F. amplifiers and idle circuit termination relay (disabling) mounting for the power supply, and a screw type terminal strip for line connections.

Selection of a 900 ohm or 600 ohm drop (2-wire) impedance and compromise network is shown under installation.

Idle circuit termination (disabling) is accomplished by relay contacts shorting the transmit branch of the 4-wire circuit prior to the transmit amplifier. The coil leads of the relay are extended to the terminal strip to permit adaptation to local circuit requirements.

A 2.0 mfd capacitor is inserted between the "A" and "B" lead connections to the hybrid for signal bypassing. The balance network has a 2.0 mfd capacitor wired into its circuit to offset the signal capacitance. If the signal bypass capacitor is strapped out, the offsetting capacitor in the balance network must also be strapped out.

Specifications

TRANS-HYBRID LOSS: (with 600 ohms in series with 2.0 mfd 2-wire termination)

TCI Library- http://www.telephonecollectors.info/
Frequency Response: Designed for 200-4,000 cps
Voice Band ± 1 db.

Maximum Operating Level: +16 dbm.

Current Capacity Signal Winding: 150 ma.

Maximum Out of Balance Current in Signal Winding: 100 ma.

Installation

Unpack TLC732 unit and inspect for concealed shipping damage. If damage is observed, file damage report with carrier and return to Webster Electric Company or Graybar Electric Company for repair or replacement.

If TLC300 series V.F. amplifiers are to be used the 4-wire branch impedances must be strapped for 600 ohms. The 2-wire (drop) impedance may be 600 or 900 ohms.

Normal usage shows that 900 ohm 2-wire impedance is most common. Therefore, Webster Electric Company has pre-strapped and tested each TLC732 for 900 ohm 2-wire and 600 ohm 4-wire operation.

When amplifiers are not used plug-in line transformers are available to match various 4-wire impedances and will directly replace the V.F. amplifiers. If amplifiers are not used, transformers must be used if signalling circuits are to be derived.

To establish hybrid impedances strap as in below tables.

2-wire (drop) 900 ohms (factory setting)
4-wire branches 600 ohms (factory setting)

Strap As Below
E8 to E7
E2 to E3
E5 to E6
E11 to E10
E14 to E15

2-wire (drop) 900 ohms
4-wire branches 600 ohms

Strap As Below
E8 to E7
E2 to E1
E5 to E6
E11 to E10
E14 to E15

After proper hybrid impedances have been selected, mount TLC101 or 106 power supply on lower chassis plate by means of two (2) 6/32 x 1¾" screws through power supply into chassis. Connect WHITE power supply pigtail to -24 or 48 VDC terminal, RED pigtail to +24 or 48 VDC terminal on screw type strip.

NOTE: If local battery or battery eliminator is used only such supplies having a low ripple voltage should be used. The TLC101 and 106 ripple voltage is less than 3 mv (rms) at full load.

Insert transmit amplifier in socket adjacent to power supply marked "TX Amp". Insert receive amplifier in socket marked "RCV Amp". Insert idle circuit relay in socket marked "Relay".

Mount unit chassis by means of mounting holes in chassis flanges.

Connect circuit wiring to screw type terminal strip as shown on schematic.

Adjust gain of amplifiers as required to maintain levels.

Idle circuit termination (disabling) relay will operate on 24 or 48 VDC. Control circuit wiring is local option to meet circuit operate requirements.

Mounting Dimensions
Description

The Webster Electric TLC736 4 wire repeater mounting shelf is designed to facilitate conversion of 4 wire telephone circuits to 2 wire facilities. As used in the Webster Electric 736 repeater system it provides services equivalent to the Western Electric Company's 24V4B systems.

The flexibility to increase the use of the 736 system to equal the larger 737 system is provided by the TLC916 mounting plate. By using the TLC916 mounting plate idle line terminating relays, filters or other auxiliary equipment may be added to the 736 system at any time.

The mounting shelf is wired to accept a wide array of Webster Electric plug-in modules facilitating quick and simple assembly of various repeater requirements. It consists of five (5) wired sockets, a test and monitor jack field consisting of ten (10) jacks and a screw type (or optional wire-wrap) terminal board located on the rear panel.

The TLC736 repeater mounting shelf is designed for KTU (key telephone unit) mountings and measures 7-7/8" deep, 5-5/16" wide by 7" high including mounting flanges.

Technical Information

The TLC736 repeater mounting shelf is completely wired and ready to accept the various plug-in components to obtain the various arrangements of repeaters normally required. Special wiring can be obtained from the Factory when required to meet special applications.

The Jack field consists of ten (10) standard 1/4" jacks wired in pairs. One jack is for monitoring only, the other is a cut out jack for insertion of test equipment. The function of each pair of jacks is clearly indicated schematically on the front panel jack field. The jack field operation is shown in the chart on Page 4.

Signal Leads

J1 socket extends the A, B, D(S1), F, G, A3 (A1), B3 (B1) and SX leads to the terminal board for various signaling requirements. Additionally, terminals for "E" type or SS-1 signaling, are provided.

For full wiring information consult Schematics 219-40000 and TE1384-3.

Application Information

Drawings TE1384-1 and TE1384-2 have been produced only for aid in cross referencing Webster Electric TLC equipment to Western Electric equipment used in 24V4 repeaters. Drawing TE1384-1 is similar to Bell Laboratories' drawing SD-97047-01-13 and shows the Webster Electric equipment that would be used to provide identical service in a 24V4 application. Drawing TE1384-2 is similar to figures 106 and 107 of Bell Laboratories' drawing SD-97047-01-14 and figure 115 of Bell Laboratories' drawing SD-97047-01-16. These two (2) drawings are to be found in the section entitled 736 and 737 Systems, under REPEATER TERMINATING UNITS in your Webster Electric Telephone catalog.
2 Wire
Mon.(J7) - Monitors 2 wire circuit
Hyb. in (J16) - Cuts out 2 wire drop and provides access to 2 wire circuit of hybrid
To cut out hybrid and test 2 wire facility insert dummy plug into hybrid in (J16) and insert test plug in mon (J7) jack.

Amplifier Input Transmit Pair
Mon (J8) - Monitors output of hybrid transmit leg and amplifier input
In (J9) - Cuts out hybrid transmit leg and provides access to amplifier input
To cut out amplifier input and test hybrid transmit leg, insert dummy plug into In (J9) jack and insert test plug in mon (J8) jack.

Amplifier Output Transmit Pair
Out (J10) - Cuts out transmit pair of 4 wire facility and provides access to amplifier output
Mon (J11) - Monitors output of amplifier and transmit pair of 4 wire facility
To cut out amplifier output and test transmit pair of 4 wire facility insert dummy plug into Out jack (J10) and insert test plug into mon (J11) jack.

Amplifier Input Receive Pair
Mon (J12) - Monitors receive pair of 4 wire facility and amplifier input
In (J13) - Cuts out receive pair of 4 wire facility and provides access to amplifier input
To cut out amplifier input and test receive pair of 4 wire facility insert dummy plug into In (J13) jack and insert test plug into mon (J12).

Amplifier Output Receive Pair
Out (J14) - Cuts out input to hybrid receive leg and provides access to amplifier output
Mon (J15) - Monitors output of amplifier and input to receive leg of hybrid
To cut out amplifier output and test receive leg of hybrid insert dummy plug into Out (J14) jack and insert test plug in mon (J13) jack.

Sockets J1 through J5 are wired for plug-in components as indicated in the following chart.

The TE1377B idle circuit relay may be used with the 736 system. This use requires a TLC916 mounting plate as a companion shelf to the TLC736 repeater shelf. See Drawing TE1384-3
Webster Electric Co. has designed the 736 and 737 Systems to provide functional equivalents to the Western Electric 24V4A, 24V4B and 24V4C.

The WECO 24V4A and 24V4C Systems are designed for mounting in 19" or 23" bays. The basic difference between the units consists of the addition of two (2) sockets to the 24V4C. The two (2) sockets are for addition of a precision network and a low pass filter. The addition of these two (2) sockets requires a new shelf (J98615BJ), and a 23" mounting. A wired plug is furnished for use when the filter or precision network is not used.

THE WEBSTER ELECTRIC 737 SYSTEM PROVIDES THE FEATURES OF THE 24V4C AND STRAP THRU PLUG-IN UNITS PROVIDE THE FEATURES OF THE 24V4A.

The WECO 24V4B provides the same services as the 24V4A but is arranged for mounting in key-unit apparatus mountings such as the WECO 16C or 31A. It is more flexible than the 24V4A due to a more versatile terminal board providing more strapping options.

THE WEBSTER ELECTRIC 736 SYSTEM IS DESIGNED TO PROVIDE THE FUNCTIONAL FEATURES OF THE WECO 24V4B AND IS ARRANGED FOR KEY-UNIT MOUNTING.

By use of the TLC916 Apparatus Mounting Plate Assembly, an idle circuit relay and/or TLC867 low-pass filter may be used. This brings the 736 System capability to the equal of the 737 System or WECO 24V4C.

Drawings TE1384-1 and TE1384-2 are systems functional blocks and are similar to Bell Laboratories drawings SD-97047-01-13, Fig. 102-105; SD-97047-01-14, Fig. 106 and 107; and SD-97047-01-16, Fig. 115. These drawings are strictly for aid in systems design and for use in cross referencing Webster Electric Equipment to Western Electric's to provide equivalent service.

The most common arrangements of the Webster 736 and 737 Terminating Repeater Systems equivalent to the WECO 24V4A, B and C are shown in the following chart.

NOTE: Fig. numbers are the same on Bell Lab. and Webster Drawings.

No separate figures are shown for use of precision network or low-pass filters since they may be used in all Webster 737 Repeater Systems, and with the 736 System when required by use of the TLC916 Apparatus Mounting Plate.

Webster Electric drawing TE1384-2, Fig. J3 shows the use of socket J3 of the TLC737. When no filter is required, strap thru assembly TLC893 is inserted in J3. When the TLC867 Low-Pass Filter is required, the TLC893 Assembly is replaced with the TLC867 Filter.

Webster drawing TE1384-3 is for use with the 736 Repeater Systems and shows the wiring required between the TLC736 Shelf and the TLC916 Apparatus Mounting Plate when a low-pass filter and/or idle circuit relay is required.

The Webster Electric TLC701 Term. Set utilizes a separate TLC851 NBOC. Precision networks manufactured by Webster Electric may be used in place of the TLC851 NBOC when required.

The TLC701 Term. Set consists of a switchable 600 to 900 ohm hybrid coil arrangement, and has a switchable compromise network (600 or 900 ohms in series with a 2.0 mfd capacitor) and signaling by pass capacitor in the A-B lead circuit. When a fixed 600 or 900 ohm compromise network is sufficient and no build out capacitance is required, the TLC851 NBOC may be omitted and J2 socket may be left vacant. If precision networks are required to obtain an acceptable hybrid balance, J2 socket is used for insertion of the network.

Networks used with the TLC701 Term. Set are listed below.

**NOTE:** Special networks available upon application.

Special arrangements:

- **Idle circuit relay:** For operation from IDLE LINE CIRCUIT CONTROL RELAY OF C.O. AND TIE TRUNK, OR RINGDOWN TIE TRUNKS equipped with signal key arrangements, to disable transmit loop on outgoing signal. Its use is predicated upon modification of the C.O. TRUNK IDLE LINE CKT. CTROL. (SD-65781-01 and SD-66522-01). This arrangement is available on the 736 System by use of the TLC916 Apparatus Mounting Plate, and on the 737 System by factory modification of the TLC737 Repeater Mounting Shelf under TE1377. When modification TE1377 is used in the 737 System, the low-pass filter can not be used due to mounting requirements of the idle relay.

See dwg. TE1384-3 for application of TLC916 Apparatus Mounting Plate for TLC867 Low-Pass Filter and idle line relay arrangement in 736 System.
Description

The Webster Electric TLC737 4 wire repeater mounting shelf is designed to facilitate conversion of 4 wire telephone circuits to 2 wire facilities. As used in the Webster Electric 737 repeater system it provides services equivalent to the Western Electric Company's 24V4A and 24V4C systems.

The mounting shelf is wired to accept a wide array of Webster Electric plug-in modules facilitating quick and simple assembly of various repeater requirements. It consists of six (6) wired sockets, a test and monitor jack field consisting of ten (10) jacks and a screw type (or optional wire-wrap) terminal board located on the rear panel.

Designed for use in a 19” or 23” rack the TLC737 mounting shelf requires 1-3/4” of panel space and measures 8-1/2” front to back fully complemented.

Ordering Information:

For 19” rack order TLC737.
For 23” rack order TLC737-1.
For TE1377 19” rack order TE1377
For TE1377 23” rack order TE1377-1

Terminals-standard screw type.
Optional-specify-wire-wrap terminals.

Note: 19’’ units may be ordered and extended to 23’’ units by use of extension mounting plates.

Technical Information

The TLC737 repeater mounting shelf is completely wired and ready to accept the various plug-in components to obtain the various arrangements of repeaters normally required. Special wiring can be obtained from the Factory when required to meet special applications.

The Jack field consists of ten (10) standard 1/4” jacks wired in pairs. One jack is for monitoring only, the other is a cut out jack for insertion of test equipment. The function of each pair of jacks is clearly indicated schematically on the front panel jack field. The jack field operation is shown in the chart on Page 4.

Signal Leads

J1 socket extends the A, B, D(S1), F, G, A3 (A1), B3 (B1) and SX leads to the terminal board for various signaling requirements. Additionally, terminals for “E” type or SS-1 signaling, are provided.

For full wiring information consult Schematics 219-39941 and TE1377.

Application Information

Drawings TE1384-1 and TE1384-2 have been produced only for aid in cross referencing Webster Electric TLC equipment to Western Electric equipment used in 24V4 repeaters. Drawing TE1384-1 is similar to Bell Laboratories’ drawing SD-97047-01-13 and shows the Webster Electric equipment that would be used to provide identical service in a 24V4 application. Drawing TE1384-2 is similar to figures 106 and 107 of Bell Laboratories’ drawing SD-97047-01-14 and figure 115 of Bell Laboratories’ drawing SD-97047-01-16. These two (2) drawings are to be found in the section entitled 736 and 737 Systems, under REPEATER TERMINATING UNITS in your Webster Electric Telephone catalog.
### 2 Wire

**Mon (J7)** - Monitors 2 wire circuit

**Hyb. in (J16)** - Cuts out 2 wire drop and provides access to 2 wire circuit of hybrid

To cut out hybrid and test 2 wire facility insert dummy plug into hybrid in (J16) and insert test plug in Mon (J7) jack.

### Amplifier Input Transmit Pair

**Mon (J8)** - Monitors output of hybrid transmit leg and amplifier input

**In (J9)** - Cuts out hybrid transmit leg and provides access to amplifier input

To cut out amplifier input and test hybrid transmit leg, insert dummy plug into In (J9) jack and insert test plug in Mon (J8) jack.

### Amplifier Output Transmit Pair

**Out (J10)** - Cuts out transmit pair of 4 wire facility and provides access to amplifier output

**Mon (J11)** - Monitors output of amplifier and transmit pair of 4 wire facility

To cut out amplifier output and test transmit pair of 4 wire facility insert dummy plug into Out (J10) and insert test plug into Mon (J11) jack.

### Amplifier Input Receive Pair

**Mon (J12)** - Monitors receive pair of 4 wire facility and amplifier input

**In (J13)** - Cuts out receive pair of 4 wire facility and provides access to amplifier input

To cut out amplifier input and test receive pair of 4 wire facility insert dummy plug into In (J13) jack and insert test plug into Mon (J12).

### Amplifier Output Receive Pair

**Out (J14)** - Cuts out input to hybrid receive leg and provides access to amplifier output

**Mon (J15)** - Monitors output of amplifier and input to receive leg of hybrid

To cut out amplifier output and test receive leg of hybrid insert dummy plug into Out (J14) jack and insert test plug in Mon (J15) jack.

Sockets J1 through J6 are wired for plug-in components as indicated in the following chart.

*TE1377B idle circuit relay is designed for use in a modified TLC737 mounting shelf (mod. TE1377). If TE1377 shelf is ordered it comes equipped with TE1377B relay for use in socket J3. A second terminal board (TB-2) is wired through and extends the “SL” and “B” leads for the idle circuit relay keying, and the “AC” and “AB” leads for wiring options D and E. (Ref: Webster drawing TE1377)
FUNCTION:
The TLC801 and 802 equalizers are plug-in modules designed to allow equalization of the facilities listed in the table below. The circuit is divided into two sections: (1) A Transformer, having low frequency loss circuits in the center-tapped secondary, to match the impedance of the facility in use. (2) A Resonant Circuit which is strapped across the output externally on the TLC801 and internally on the TLC802.

CIRCUIT DESCRIPTION:
The general block is as follows: R and C provide low frequency equalization and R' L' C' provide higher frequency equalization, if required, different values of R and C may be obtained by a switch located on the outside of the unit. Various values of L' and C' are obtained by the facility switch of the inside of the unit and R' is a variable resistance located on the outside. The internal facility switch allows the unit to be used for H88, H44, Non-loaded are open wire facilities. The external switch provides various amounts of equalization or a short across R & C so no equalization is in the circuit and the TLC801 or 802 may be used as impedance matching transformers alone.

NOTE - Pins 5, 6, 7 & 8 on the TLC802 provide a continuity path for a transmitting pair.

SPECIFICATIONS:
- Line Input Impedance: 1200-600-150 OHMS
- Output Impedance: 600 OHMS
- Symplex Current: 5 MA. out of balance
- Size: 1-5/8" x 1-5/8" x 5-5/8" overall
- Weight: 1 lb.
- Finish: Zinc plate with Dichromate finish
- Plug: 11 Pin 86CP11

965ML 1.5 Litho in U.S.A.
NOTE: Switch contacts 1-12 were not stamped on early Model S1 switches.
NOTE: Switch contacts 1-12 were not stamped on early Model S1 switches.

SCHEMATIC TLC 802 EQUALIZER
The TLC811 pad adaptor is equal to the Western Electric 1C type pad and will accept the Western Electric 89 type plug in resistors to provide circuit attenuation in .25 db steps.

The TLC811 pad adaptor is a plug in unit and is normally inserted in J3 and J6 of the TLC731 unit when required. If pad adaptors are not used, wired dummy plugs are provided for circuit continuity and must be inserted in place of the TLC811 pad adaptor.

The TLC813 variable attenuator (0-25 db in 5 db steps), or the TE1284 attenuator (0-40 db in 1 db steps) may be used in place of the TLC811 pad adaptor if desired.
FUNCTION:
The TLC813 Attenuator is a plug-in unit designed specifically for use in telephone circuits to provide step Attenuation of V.F. levels.

SPECIFICATIONS:
Precision "T" pads, constructed of 1/2 W 1% resistors provide precise Attenuation in steps of 5 db thru the range of 0-25 db.

Selection of Attenuator steps is by means of a, front panel mounted 6 position, rotary switch.

The value of each step is clearly silk screened on the front panel allowing rapid selection of Attenuator steps.

All resistors are 1/2 W 1%
**FUNCTION:**
The TLC831 Transformer is designed for applications where Hybrid circuits are derived from two (2) separate plug-in transformer modules. When two (2) TLC831 transformers are used a return loss factor of at least 30 db is obtained over the V.F. band of 300-4,000 CPS.

**SPECIFICATIONS:**
By proper wiring of the socket 2 wire impedances of 600 or 900 ohms may be derived. When the 900 ohm 2 wire impedance is used the 4 wire circuit impedance may be selected for 600 or 900 ohms.

Electrostatic shields are provided to minimize the longitudinal effects.

**Hybrid Arrangement:**
- Two (2) TLC831 Transformers.
- 2 wire: 600 or 900 ohms.
- 4 wire: 600 ohms when 600 ohm 2 wire impedance is used. 600 or 900 ohms when 900 ohm 2 wire impedance is used.

**Insertion Loss:**
- 4 db maximum 200-6,000 CPS.

**Trans-Hybrid Loss:**

**Plug:**
12 pin amphenol (to mate with amphenol 77 M1P12 socket)

The above drawing shows two (2) TLC831 transformers connected to provide a full Hybrid circuit. Signalling facilities may be derived from pins 8 & 9 of T2 by extending the "A" & "B" leads from the socket as shown. If signalling is not required, points 8 & 9 must be strapped.

**For 600 Ohm Impedance:**
For 600 Ohm impedance of two wire circuit use appropriate 600 ohm balancing network. Transmit and receive circuits are connected to points 1 & 2 of respective sockets.

**For 900 Ohm Impedance:**
For 900 Ohm impedance of two wire circuit use appropriate 900 ohm balancing network. If 600 ohm transmit and receive circuits are desired connect circuit to 10 & 7 of respective transformer. If 600 ohm two wire and transmit and receive circuits are desired connect transmit and receive circuits to points 1 & 2 of respective transformers.
FUNCTION:
The TLC832 repeating coil is designed to provide high quality and efficient operation between the combination of impedances listed below. When used in a balanced circuit, the balanced windings of this transformer provide 90 db attenuation to longitudinal currents. Electrostatic shields are provided. It has a frequency response of 20-20,000 cps ± 1 db, and a maximum operating level of 25 dbm. The windings will handle 150 ma of ringing current. This transformer provides at least 50 db of magnetic shielding.

SPECIFICATIONS:
This transformer is of the plug-in type and as Standard has a 11 pin amphenol 86CP11 plug so that eight (8) transformers may be mounted on a 19" rack panel requiring 1-3/4" of panel height. THIS TRANSFORMER MAY BE EQUIPPED WITH A 12 LUG HEADER, if so ordered, AT NO EXTRA COST, when it is desired to solder leads directly to the transformer.

TRANSFORMER CONNECTIONS:
Source Impedance: 500/600 - connect source to 1 & 5, strap 2 & 3. C. T. is 2 & 3
125/150 - connect source to 1 & 5, strap 1 & 3, 2 & 5. C. T. is 4
125/150 - connect load to 6 & 10, strap 6 & 9, 8 & 10. C. T. is 7.
NOTE: To phase all coils in series aiding strap 2 & 3, 5 & 6, 8 & 9.
Dimensions: 5-9/16" length x 1-5/8" sq.
Weight: 1 lb. approximately
Finish: Telephone Gray
COMMUNICATIONS DIVISION
WEBSTER ELECTRIC COMPANY, INC.
subsidiary of Sta-Rite Industries, Inc.
installation and maintenance manual

Racine, Wisconsin 53403

FUNCTION:
The TLC833 line transformer is designed to meet requirements of the telephone industry for providing a 600 ohm drop impedance from a variety of line impedances.

SPECIFICATIONS:
If signalling facilities are required line impedances of 150, 250, 600 and 900 ohms may be obtained by proper strapping on the mounting socket.

Impedances:
- Drop: 600 ohms 200 to 3 KC IDC = 100 MA
- Line: 600 or 900 ohms when signalling facilities are required. 150 or 250 ohms when signal facility not required.

Insertion Loss:
- 0.5 db at 1,000 CPS

Frequency Response:
- ± 1 db 100-10,000 CPS Ref. 1 KC

Maximum Operating Level:
- 120 MA

Maximum out of Balance Current:
- 100 MA

Dimensions:
- 4-31/32" long (excluding plug) x 1-5/8" SQ. (may be mounted on 1-3/4" high panel).
- Electrostatic shielding provided to minimize longitudinal effects.

Finish:
- Zinc plate with Dichromate finish.

Socket:
- 11 pin amphenol 86CP11 standard optional (12 pin amphenol) (to mate with 77 M1P12 socket).
- 1 lb. approximately

GENERAL:
The TLC834 Transformer assembly is a plug-in module containing two (2) miniature line transformers and a front panel mounted impedance switch. The primary windings have an impedance of 600 ohms. The secondary windings have selectable impedances of 150, 600 or 1200 ohms with simplex taps.

Operation of the front panel impedance switch selects either 150, 600 or 1200 ohm impedance values of both transformers secondaries at the same time. Independant selection of different impedance on each coil is not possible.

The TLC834 unit has been designed primarily for use in Webster Electric 2 to 4 or 4 to 4 wire repeaters. It may be used in WECO 24V4 systems in place of the 359 type equalizers by means of the Webster Electric TLC895 adaptors and when Webster Electric TLC300 series amplifiers equipped with TLC894 adaptors are used in place of WECO 227A, B or C amplifiers.

It may be used in any 4 wire V.F. facility when both transmit and receive circuits must be converted from 600 to 150, 600 or 1200 ohm impedances.

SPECIFICATIONS:
Impedance: Primary: 600 ohms ± 10%.
Secondary: 150, 600 or 1200 ohms ± 10%.

Impedance Switch: Front panel mounted.
Frequency Response: ± 0.5 db 200-10,000 cps.
Insertion Loss: 1.25 db 200-5,000 cps.
(1.5 db @ 10,000 cps)

Simplex Current: Max. 100 ma (5 ma out of balance).

Longitudinal Balance: Bifilar windings w/Electrostatic shielding provided to obtain maximum attenuation to longitudinal currents.

Size: 1-5/8" x 1-5/8" x 5-5/8" overall.
Finish: Zinc plate dichromate finish.
Plug: 11 pin 86CP11.
Weight: 16 oz. approx.
GENERAL

The TLC835 and 836 level control pad adaptors are designed to be used with WECO 89 type resistors for level control of V.F. circuits when gain is not required. They are the functional equivalent of the WECO 849A & B level control pads with the added feature of having the secondary windings switchable in impedance from 150 to 600 or 1200 ohms. Simplex taps are provided.

The pad adaptor resistive network is on the 600 ohm primary winding cycle of the transformer and is fixed in impedance.

Designed for use in Webster Electric 2 to 4 wire and 4 to 4 wire repeater systems the TLC835 is designed to be used in the transmit amplifier socket while the TLC836 is designed for use in the receive amplifier circuit.

These units may be used for level control and impedance matching in any V.F. circuit when required. It mounts in a standard 11 pin octal socket.

INSTALLATION:

By removing the chassis from the cover assembly the screw driver adjustable impedance switch is exposed. Switch index positions are clearly marked 1200 - 600 - 150 for 1200, 600 or 150 ohm selection.

SPECIFICATIONS:

impedance: primary: 600 ohms ± 10%.
   secondary: 150, 600 or 1200 ohms ± 10%.
impedance switch: internally mounted rotary switch.
frequency response: ± 0.5 db 200 - 10,000 cps
insertion loss: 1.25 db 200 - 5,000 cps
   (1.5 db @ 10,000 cps)
simplex current: max. 100 ma (5 ma out of balance)
longitudinal balance: bifilar windings w/ electrostatic shielding provided to obtain maximum attenuation to longitudinal currents.
size: 1-5/8" x 1-5/8" x 2-1/4" overall (less 89 resistor)
finish: zinc plate dichromate finish
plug: 11 pin 86CP11
weight: 16 oz. approximately

TCI Library- http://www.telephonecollectors.info/
FUNCTION:
TLC837 Hybrid Coil Assembly is a plug-in unit for use in deriving 2-4 wire telephone circuits.

TLC837 is completely wired, containing the hybrid coils, a front panel impedance switch and two (2) 1.0 mfd capacitors. All legs of the hybrid, including the A and B leads and the balancing winding are wired to the 11 pin amphenol plug. No compromise or signal bypass networks are provided within the unit. Designed primarily for use in the Webster 733, 740 or 741 repeater systems, the unit may also be mounted in any suitable mounting plate equipped with appropriate 11 pin sockets.

Although the small physical size of TLC837 makes it suitable for mounting in standard VF amplifier shelves, the hybrid coil is the same precision, high quality coil used in the Webster TLC701 and 711 term sets.

INSTALLATION:
Front panel mounted impedance switch is internally wired to the hybrid coils so that either 600 or 900 ohm, 2-wire circuits may be obtained. Two (2) 1.0 mfd capacitors are wired in parallel in the hybrid balancing windings to offset signal bypass capacitance.

CAUTION: If A and B leads, or DC blocking of the 2-wire circuit (Tip and Ring), are not required, the A and B leads (Pins 5 and 6) must be strapped on the mating socket and the two (2) 1.0 mfd capacitors (C1 and C2) must be strapped out of the balance winding. (Cover of TLC837 must be removed to strap out C1 and C2). Capacitance for deriving A and B leads must be externally provided.

External hybrid balancing networks, either compromise or precision types, must be used with TLC837. Webster networks TLC852 thru TLC856 are suitable for such use. All of the above networks also contain signal bypass capacitors for deriving A and B leads from the TLC837.

When used in arrangements other than the Webster 733, 740 or 741 repeater systems, wiring should be made directly to the mating socket. Suggested for mounting are Webster TLC904, 905 or 916 mounting shelves. TLC904 is for 19” rack mounting, TLC905 for 23” mounting, and TLC916 for KTU mountings. Appropriate balancing networks should be mounted adjacent to TLC837.

Connections to the mating socket are as follows: (See figure 2)

2-Wire Branch: Tip to Pin 1
Ring to Pin 2

A and B Leads: A to Pin 5
B to Pin 6

Transmit Branch: Tip to Pin 3
Ring to Pin 4

Receive Branch: Tip to Pin 8
Ring to Pin 7

Balance Network: To Pins 9 and 10

Chassis Ground: Pin 1!

If A and B leads are used, connect pins 5 and 6 to bypass network in balancing network. See Caution note above.

NOTE: To obtain maximum return loss, the capacitance in the A-B lead circuit and the balancing windings (C1 & C2) must be equal. If 0 mfd is used for signal bypass in the A-B leads, C1 & C2 must be in parallel.

If 1.0 mfd is used in the A-B lead circuit unsolder one side of C2 capacitor and tape back.

OPERATION:
Operate the front panel switch for either 900 ohm 2-wire impedance, or for 600 ohm 2-wire impedance. In either position the proper ratio is maintained to provide 600 ohm impedance on the 4-wire branches.

It is to be noted that in the 600 ohm position the coil ratio is 1:1. This position should be used at all times except when 900 ohm 2-wire circuits are encountered.
MAINTENANCE:

When properly connected, no appreciable maintenance will be required other than routine operational checks as may be required.

SPECIFICATIONS:

Impedances:

- 2-Wire: 600 or 900 ohm selectable with panel mounted switch.
- 4-Wire: 600 ohm.

FIG. 1 DIMENSIONS
TLC851 NBOC

The TLC851 NBOC (Net Building Out Capacitors) unit is a plug-in module to provide additional capacitance for the integral compromise network of the TLC701 term set, or for precision matching of capacitance in the 2-wire circuit.

The front panel of the TLC851 NBOC unit mounts seven (7) screw type switches which when closed (full clockwise) allows adding of capacitance to the compromise network of the TLC701 in .001 mfd steps from .001 to .10 mfd, by paralleling the desired capacitors.

No wiring of the TLC731 unit is required. Simply plug in the TLC851 NBOC unit and select the desired capacitance from the front panel.

When precision networks are required for balancing against specific cable sections consult the NETWORK section of the Webster Electric Telephone Products catalog.
FUNCTION:
The TLC852 precision network is a plug-in unit which provides a precise balance in hybrid circuits against unloaded cable circuits.

SPECIFICATIONS:
The network consists of a series network of precision resistors plus a termination resistor. By appropriate strapping the correct resistive element may be obtained. Capacitance may be introduced if needed by proper strapping of the capacitor network which consists of seven (7) capacitors ranging in value from 0.033 mF to 0.18 mF.

A silk-screened strapping circuit board is exposed when the unit cover is removed. All strapping of resistive and capacitive elements is by means of soldering straps between the appropriate circuit elements on this board.

By-pass facilities are provided. However, when used with Webster Electric TLC701 4 wire termination set, signal by-pass facilities are not used, since the TLC701 has this feature included.

Dimensions: 4-31/32" long (excluding plug) x 1-5/8" x 1-5/8"
Finish: Zinc plate with Dichromate finish
Plug: 11 pin amphenol 86CP11
Weight: 1 lb. approximately

### Diagram

The diagram is a schematic representation of the wiring connections for a line input. It includes various symbols for resistors (R), capacitors (C), bypass facilities (BY), line input (LINE), bypass (BYP), and ground (GND). The connections are indicated with lines and numbers, and the text provides specific resistance values for each component. The diagram is labeled with the copyright notice: "COPYRIGHT © 1967 WEBSTER ELECTRIC CO., INC."
FUNCTION:
The TLC853 precision network is a plug-in unit which provides a precise balance in hybrid circuits against H88 type loaded cable circuits.

SPECIFICATIONS:
The TLC853 contains a basic circuit consisting of inductance, capacitance, and resistance, and a series of building out capacitors to allow close matching of termination to the cable facility.

By-pass facilities are provided. However, when used with Webster Electric TLC701 4 wire termination set, signal by-pass facilities are not used, since the TLC701 has this feature included.

Strapping on the internal circuit board allows use on 19CNB H88, 22BSA H88, 16th H88 facilities.

Proper build out capacitance is obtained by proper strapping on the internal circuit board (.001 - .033 mf.)

Dimensions: 4-31/32" long (excluding plug) x 1-5/8" x 1-5/8"
Finish: Zinc plate with Dichromate finish
Plug: 11 pin amphenol 86CP11
Weight: 1 lb. approximately

TCI Library - http://www.telephonecollectors.info/
FUNCTION

The Webster Electric TLC855 adjustable compromise network is designed for use in hybrid arrangements to obtain a compromise balance against the two (2) wire facility.

The TLC855 network is designed to plug into an Amphenol 78-S11 socket and consists of an adjustable resistive network in series with 2.0 mfd. of capacitance, four (4) net building out capacitors and two (2) 1.0 mfd. capacitors for deriving signaling circuits.

The adjustable resistive network consists of R1, R2 and R3 and provides a resistive element adjustment thru a range of 400 to 1400 ohms.

The four (4) net build out capacitors, C3 thru C6, are for use in balancing out the two (2) wire cable capacitance. Capacitance required may be determined at the C and C-R test sockets on the front panel. The resistive element of the network may be pre-adjusted at the R and C-R test sockets. Wire straps must be connected on the internal strapping board to obtain NBOC balance as required, and to derive signaling circuits when used with TLC831 hybrid coils.

When this unit is used with Webster Electric TLC701 term sets, the signal by-pass capacitors C7 and C8 are not used. The TLC701 term set is equipped with internal by-pass capacitors.

SPECIFICATIONS

**Resistive Network:** Externally adjustable from 400 to 1400 ohms.

**Net Build Out Capacitors:** 4-with internal strapping facilities.

**Signal By-pass Capacitors:** 2-with internal strapping facilities.

**Test Jacks:** Accessable on front for predetermining resistance and capacitance requirements.

**Plug:** 11 pin Amphenol (86CP11) fits Amphenol socket #78-S11.

**Finish:** Zinc plate with Dichromate finish.

**Dimensions:** 1-5/8” sq. x 4-31/32” long excluding plug.

**Weight:** 10 oz.
**INSTALLATION:**

The hybrid balance pair is connected to pins 1 and 2, the signal by-pass capacitors to pin 3 and 4, of the 11 pin plug. When 1.0 mfd. is required in the signal by-pass circuit, no internal strapping is required. If 2.0 mfd. is required in the signal circuit, strap E6 to E7. Chassis ground is connected to pin 11. When extracting the TLC-855 unit from its mounting socket a TLC914 extractor tool should be used to prevent damage to the plug and socket.

**ADJUSTMENT**

When adjusting the TLC855 network the test jacks; C, R and C-R located on the front panel may be used. The resistive element is adjusted by potentiometer R1. Test jacks R and C-R are used for resistive adjustments. A capacitance decade box may be connected to test jacks C and R-C and adjusted for maximum transhybrid loss. When the capacitance determined by the decade box is determined, the NBOC value may then be permanently strapped between terminals E1 and E8.

R1 should be adjusted to the known resistive element of the two (2) wire line before insertion into its mounting socket. After insertion and when the capacitance has been determined by the capacitance decade box, R1 may require a slight readjustment to obtain optimum transhybrid loss. After final adjustment of R1 its locking nut should be carefully tightened.

The NBOC (C3 thru C6) may be wired in parallel, series or series parallel to obtain the required capacitance - see strapping chart.

</tbody>
</table>

Other values of capacitance may be obtained by parallel, series or series parallel strapping of capacitors.

**MAINTENANCE**

Field maintenance is limited to replacement of resistors and capacitors and must be replaced with equal value components. It is suggested that the TLC855 unit be returned to the factory when repairs are required.
FUNCTION:
The TLC 866 and 867 filters are low pass type having an effective band pass of 0 to 2,580 cps and a cut off frequency of 3,000 cps. Designed for use in 600 ohm telephone transmission circuits. The balanced circuit configuration provides excellent voice band articulation. The 867 is designed for use with the Webster 2-4 wire terminating systems.

SPECIFICATIONS:
The TLC 866 and 867 filters are of the plug-in type and are normally supplied with an Amphenol 86CP11, 11 pin plug for use with Webster Electric Company terminating systems. The 866 may be ordered with a 20 pin plug for mounting in an Amphenol 77MIP-20 socket at no extra cost if desired.

Type: Low pass filter (0-2850 cps), balanced.
Impedance: 600 ohm nominal.
Insertion Loss vs Frequency:
- 0.2 db - 50 - 2,000 cps
- 2.4 db - 2,850 cps
- 11.6 db - 3,100 cps
- 35.8 db - 3,400 cps
- 41.4 db - 3,500 cps.
Dimensions: 1-5/8" x 1-5/8" x 5-5/8" overall.
Weight: 12 ounces approximately.
Color: Zinc plate with dichromate finish.
Plug: 11 pin Amphenol 86CP11 (standard). (Optional) 20 pin plug to mount in 77MIP-20 socket.

Typical Frequency Characteristics:

- Insertion loss <0.3 db up to 2000 cps
- Frequency in cycles per second
- Db loss

Litho in U.S.A.
FUNCTION
TLC881 thru 884 relay assemblies are designed to provide "Idle Circuit" termination in Webster VF repeater systems. This series of Idle Circuit relays provide a direct short across the transmit branch of the hybrid in Webster 732, 733 and 737 repeater systems. They may be used in 736 systems when TLC916 KTU apparatus mounting plates are used.

The relay assemblies are completely wired. TLC881 and 882 are mounted in clear plastic cases, and are primarily intended for use in the 732 system. TLC883 and 884 are enclosed in metal cans, and are designed specifically for use in 736 and 737 repeater applications.

TLC881 and 883 are designed to utilize 24 VDC power sources, TLC882 and 884 are designed for 48 VDC systems. Each relay consists of two (2) Form "A" contacts wired in parallel.

INSTALLATION
Make certain that the relay selected matches the power source to be used. If used in the Webster 732, 733 or 737 systems, the relay mounting socket is properly wired. Consult the appropriate system schematic for wiring of relay control circuitry.

When used in special field wired systems, wire mating sockets as follows:
- Transmit Branch of Hybrid: Terminals 1 & 2
- Transmit Branch to Amplifier: Terminals 3 & 4
- Relay Operate Circuit: Terminals 5 & 6
- Chassis Ground: Terminal 11

Wiring between terminals 7 & 9 and 8 & 10 are factory wired to provide continuity of the receive branch in factory wired repeaters only.

SPECIFICATIONS
- Contacts: 2, Form "A" wired in parallel
- Contact Material:
  - TLC881 - Silver
  - TLC882 - Silver
  - TLC883 - Gold Plated Silver
  - TLC884 - Gold Plated Silver
- Coil Resistance:
  - TLC881 - 500 ohms
  - TLC882 - 1300 ohms
  - TLC883 - 500 ohms
  - TLC884 - 1500 ohms
- Dimensions:
  - TLC881 & 882: 1-3/8" x 1-3/8" x 2-5/16"
  - TLC883 & 884: 1-5/8" x 1-5/8" x 5-5/8" overall
- Color:
  - TLC881 & 882: Clear Plastic
  - TLC883 & 884: Zinc Plate with Dichromate finish.
- Plug: 11 Pin (Amphenol 86CP11)

GENERAL
The TLC891, 892 and 893 strap thru assemblies are designed for use with Webster Electric 2 to 4 wire and 4 to 4 wire V.F. repeaters systems. Their function is to provide circuit continuity when other plug-in modules (listed below) are not used.

The TLC891 assembly is used in the transmit or receive amplifier sockets.

The TLC892 assembly is used in the equalizer socket.

The TLC893 is used in the filter or idle circuit relay socket.

INSTALLATION
These units are not interchangeable due to socket wiring arrangements. Care must be taken that the proper strap thru assembly be used otherwise power supply voltage may be shorted or transmission circuit continuity may be interrupted.
GENERAL:
The TLC 894 is an adapter unit which allows a Webster Electric TLC V.F. amplifier to be plugged into a Western Electric amplifier socket.

The TLC894 adapter is primarily designed for use in 600 ohm circuits. The fifteen pin plug (P1) has straps between pins 2 & 4, and 8 & 10. This is to provide proper circuit connection between 600 or 1200 ohm circuit arrangement. Actual impedance of input and/or output of the Webster Electric V.F. amplifier is determined within the adapter by simple strapping.

SPECIFICATIONS:
size: 1-5/8 x 1-5/8 x 1-1/2 excluding plug,
finish: Zinc plate with dichromate finish.
socket: Amphenol s78-S11.

INSTALLATION:
Caution: The internal straps on P1 (pins 2-4, 8-10) are for transmission circuit continuity only. If WECO 359A or 359D type equalizers are used the equalizing circuit will not be connected thru to the amplifier. Where equalization of the receive circuit is required a Webster Electric TLC 802 universal equalizer equipped with a TLC 895 adapter may be used in place of the WECO equalizer.
**FUNCTION:**
The TE1286 line transformer is designed specifically to provide an output (drop) impedance of 1500 ohms from various line input impedances.

**SPECIFICATIONS:**
By proper strapping on the socket, which mounts the plug-in transformer, line impedances of 125, 150, 500 or 600 ohms may be obtained, while maintaining the 1500 ohm drop impedance.

Designed for telephone V.F. circuits, electrostatic shields are provided to minimize longitudinal effects.

- **Impedance Loss:**
  - Drop 1500 ohms source - 125/150, 500/600 ohms 200 to 3 KC
  - Less than 0.6 db at 1000 cps

- **Frequency Response:**
  - ± 1 db 100-10,000 cps ref to 1 KC IDC = 0 MA

- **Maximum Operating Level:**
  - + 20 dbm

- **Maximum Current in Line Winding:**
  - 100 MA

- **Maximum out of Balance Current in Line Winding:**
  - 100 MA

- **Dimensions:**
  - 5-5/8" overall length x 1-5/8" x 1-5/8"

- **Finish:**
  - Zinc plate with dichromate finish

- **Plug:**
  - 11 pin Amphenol 86CP 11

- **Weight:**
  - 1 lb. approximately

FUNCTION:
To provide mounting facilities for one power supply and two voice frequency (VF) Amplifiers or three VF Amplifiers.

SPECIFICATIONS:
Mounting Provision for TLC 101 or 106 Power Supply: Mounted by two 6-32 x 1-3/4 screws.
Mounting Provision for VF Amplifiers: Two 11 pin octal sockets, three 11 pin octal sockets when power supply is mounted outside.
VF Amplifier Input and Output Connections: Screw type barrier strip.
Power Supply Connections: Screw type barrier strip.
Size: 10 long x 6-5/16 wide x 3-1/2 deep.
Weight: 3-1/2 lbs.

INSTALLATION:
1. Attach a power supply to the base of TLC 902, using two mounting screws furnished.
2. Connect red and white wires with spade lugs from power supply to terminals 14 and 13 respectively on barrier strip.
3. Make VF Amplifier external connections to barrier strip as shown in wiring diagram of TLC 902.
4. Install two VF Amplifiers (24 volts, 30-50 MA or 48 volts, 30-50 MA as required) by plugging them into the sockets. If only one VF Amplifier is used, a plug with dummy load should be provided in the unused socket. If power supply is not provided, a third VF Amplifier may be installed.
5. A grounding prong on the power cord plug is provided to ground the power supply. If a grounding type outlet is not available, use a 3 to 2 prong adaptor, and connect the grounding terminal of the adaptor to ground. Do not break off the grounding prong of the plug.
NOTES:
1. SOCKET C IS NOT USED WHEN TLC 101 OR TLC 106 POWER SUPPLY IS INSTALLED
2. SOCKET A IS TO THE LEFT WHEN THE UNIT IS Viewed FROM THE WIRING SIDE OF THE SOCKETS WITH THE MOUNTING PLATE DOWN
3. POWER SOURCE TO TERMINALS 13-14 MAY BE TLC 101 OR TLC 106 AS REQUIRED OR MAY BE AN EXTERNAL POWER SOURCE
4. SUPPLY DUMMY II POINT PLUG WITH APPROPRIATE LOAD RESISTANCE FOR POWER SUPPLY WHEN ONLY ONE AMPLIFIER IS INSTALLED

EXTERNAL CONNECTIONS SHOWN FOR TERMINALS 15-28 IN THIS VIEW ARE FOR AMPLIFIERS HAVING A SPLIT LOOP FOR BOTH INPUT AND OUTPUT. CAPACITORS SUGGESTED ARE MOUNTED EXTERNAL TO AMPLIFIER.

EXTERNAL CONNECTIONS SHOWN FOR TERMINALS 15-28 IN THIS VIEW ARE FOR AMPLIFIERS HAVING SIMPLEX CONNECTIONS FOR BOTH INPUT AND OUTPUT.

EXTERNAL CONNECTIONS SHOWN FOR TERMINALS 15-28 IN THIS VIEW ARE FOR AMPLIFIERS HAVING SIMPLEX CONNECTIONS FOR BOTH INPUT AND OUTPUT.

EXTernal CONNECTIONS SHOWN FOR TERMINALS 1-14 IN THIS VIEW ARE TYPICAL FOR ALL STANDARD TYPES OF AMPLIFIERS.

EXTernal CONNECTIONS SHOWN FOR TERMINALS 15-28 IN THIS VIEW ARE FOR AMPLIFIERS HAVING LOOP INPUT AND OUTPUT AND HAVING MONITOR CONNECTIONS TO THE PLUG.
APPLICATION:
Two models of Mounting Shelf are available. Catalog No. TLC 904 mounts 10 Webster VF Amplifiers in a 19-inch relay rack; Catalog No. TLC 905 mounts 12 Webster VF Amplifiers in a 23-inch relay rack.

SPECIFICATIONS:
For use with:
Webster Voice Frequency (VF) Amplifiers, all models.

VF Amplifier Mounting Provisions:
TLC 904:
Horizontally mounts up to 10 VF Amplifiers side by side in 11-pin octal sockets.
TLC 905:
Horizontally mounts up to 12 VF Amplifiers side by side in 11-pin octal sockets.

Size:
TLC 904:
Requires 1 rack mounting space (1-3/4") in 19" rack; 6-1/8" deep.
TLC 905:
Requires 1 rack mounting space (1-3/4") in 23" rack; 6-1/8" deep.

Weight:
Two pounds.

ACCESSORIES:
Extractor Tool TLC 914:
Extracts VF Amplifiers from Mounting Shelf.

INSTALLATION:
1. Fasten Mounting Shelf in relay rack, using four mounting screws (two on each side).
2. Make VF Amplifier external connections according to appropriate figure on reverse side of this sheet or as required for type of amplifiers used.
3. Install desired number of VF Amplifiers by plugging them into sockets provided on Mounting Shelf.
4. To remove a VF Amplifier, use approved extractor tool that fits into flange holes at front of VF Amplifier.
NOTES
1. TLC 905 CONTAINS XA-11 & XA-12 IN ADDITION TO THOSE PICTURED
2. UNUSED PINS NOT SHOWN IN FIGS 1 THRU 5
3. INDICATES TWISTED PAIRS

The TLC909 and 910 amplifier mounting shelves were designed to accommodate two TLC amplifiers—not included—when updating existing private line service by providing additional gain for long truck line.

The amplifiers are mounted vertically in the TLC909 shelf and horizontally in the TLC910. Both pre-wired units provide four jack facilities for testing voice frequency levels at inputs and outputs to the two amplifiers so that proper gain for optimum performance may be easily adjusted at time of installation.

The shelves were designed specifically to mount in the Western Electric 1A1 Key Cabinet, or in any “KS” system using W. E. “67B” mounting rails. Each unit is supplied complete with screw type terminal board, four jacks with tip-ring cut-off for measuring amplifier gain, and sockets and necessary hardware for mounting the TLC amplifiers.

**TLC 909 VERTICAL MOUNTING SHELF FOR 2 TLC AMPLIFIERS**

- Required for single 4-w terminal type amplifiers
- 4 jack tips-ring cut-off
- Amplifier gain
- Terminal boards
- Amplifiers must be ordered separately.

**TELEPHONE LINE COMPONENTS**
NOTE:
1. TLC Type Amplifiers shown are not part of this Assy.
2. Supply voltage is determined by Amplifiers used.
FUNCTION:
Provide input and output jack facilities for TLC type VF amplifiers where mounted on TLC 912 or TLC 913 amplifier mounting shelf.

SPECIFICATION:
Eleven point plug wired to two double cut-off jacks to disconnect lines and permit connection to the input and output of the associated amplifier by means of test plugs. Zinc plating with dichromate finish.
**TLC 912 MOUNTING SHELF**

*FOR 5 TLC AMPLIFIERS AND 5 TLC 911 JACK ASSY'S.*

bulletin 211-38566

amplifier mounting shelf assembly

TCI Library- http://www.telephonecollectors.info/
FUNCTION: Provide mounting facility for a single TLC type VF amplifier in a standard apparatus box.

SPECIFICATION: One 11-point socket to accept VF amplifier plug. One 6-point barrier strip to provide screw type connections for input, output, and power leads. Two holes for mounting into apparatus box or other suitable fixture.

Note: Add ground strap from socket pin 11 to ground lug if required.
FUNCTION:
The TLC916 mounting shelf is designed primarily as a companion mounting for increasing the capabilities of the Webster TLC736 2-4 wire terminating system. By use of this mounting, idle circuit termination, filters or other auxiliary equipment may be added to the 736 repeater system. For applicational drawing see Bulletin TE1384-3.

SPECIFICATIONS:
The TLC916 mounting shelf is designed to mount in standard KTU mountings. The shelf, consisting of three 11 pin amphenol sockets, mates with plug-in modules using 86CP11 plugs. Each socket is wired through to a rear mounted screw type terminal strip. Supporting shelf type brackets are provided to support the plug-in modules. The unit is finished in telephone grey baked enamel.
FUNCTION
The TE-1377B relay assembly is designed for use in the Webster TE-1377A repeater. It provides protection from ringing splash when Ring Down conversion to E & M or other types of signalling is employed.

INSTALLATION
The TE-1377B relay has been designed for use only in the TE-1377B Webster repeater shelf. This shelf is a factory modified TLC737. Use of this relay in other repeaters may cause damage. Consult Webster Electric dwg., TE-1384-3, Fig. 302 for use of this relay in Webster Electric 736 repeater systems. This relay may be used in other "Idle Circuit" applications when appropriate wiring is provided.

The TE-1377B relay is shipped with internal strapping for 24 VDC operation. If 48 VDC operation is desired, remove cover from TE-1377B and remove strapping around R2 resistor.

OPERATION
Normally inserted in the 4-wire transmit branch of the repeater, it provides a 600 ohm termination to the transmit circuit and opens the hybrid transmit circuit in the "Idle" condition. In the operated condition, "make before break" contacts complete the hybrid circuit to the 4-wire transmit circuit and removes the 600 ohm termination. Contact arrangements are provided for proper operation from tie line trunk circuit or C. O. trunk circuits per Illinois Bell dwg., CS506-0100A.

Two wiring options are available, "D" and "E", these are for control wiring of tie trunks or C. O. trunks, and should only be used when dwg., CS506-0100A is called out.

A nylon screw in the front panel provides for mechanical operation of the relay.

SPECIFICATIONS
- Operating Voltage: 24 or 48 VDC at .040 Amp (internal strapping provides for 24 or 48 VDC operation)
- Contacts: Twin, Palladium silver.
- Controls: Front panel nylon screw mechanically operates relay.
- Test Jacks: Accessible from front panel; wired for "D" option testing.
- Dimensions: 1-5/8" x 1-5/8" x 5-5/8" overall.
- Weight: Approximately 16 oz.
- Color: Zinc plate with dichromate finish.
- Plug: 11 pin, (Amphenol 86CP11).
NOTE: "SL" AND "B" LEADS CONNECT TO TIE LINE TRK CKT, CO. TRK OR AS SPECIFIED FOR RELAY OPERATION.
"E" AND "D" WIRING ARE OPTIONS.
