The Stromberg-Carlson No. 1212
Self-contained Handset

She insists ON A TELEPHONE IN KEEPING WITH *her* HOME

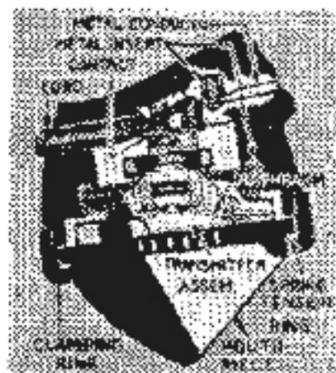

In its No. 1212 Handset, Stromberg-Carlson has proved that a telephone in addition to being an instrument of utility can also be a decorative article.

Of particular interest to discriminating subscribers is the fact that their walls need no longer be defaced by a bell box, for this instrument is completely self-contained—induction coil, ringer and condenser being mounted in the base of the instrument. Two-tone gongs provide a pleasant yet attention-compelling signal. The instrument is light in weight.

By ordering a test sample of the No. 1212 Handset, you can prove to yourself what an aid it will be in selling new subscribers or extension service.

Specially designed induction coil and condenser are small and compact, yet do the work of larger units with equal efficiency.

The patented transmitter used with the Stromberg-Carlson 1212 Handset employs the cone-shaped diaphragm of a radio speaker. It moves as a rigid piston. Maximum flexibility is insured by angular corrugations near the outer edge.

Firm clamping of the diaphragm without excessive tension is insured at all times because the ear cap's thread is entirely independent of the receiver's mounting thread. The result is a quality of reception that pleases subscribers.
